Plaza de Dolores, Santiago de Cuba; primera fiesta infantil, "Día de la Libertad de los Niños," instituida por la Sra. Katherine Tingley en su primera visita a Cuba después de concluida la guerra, y declarada fiesta anual oficial de la Ciudad por el Sr. Emilio Bacardí, Alcalde de Santiago. Para conmemorar esta fecha, los niños plantaron dos árboles en la plaza, uno en honor de Cuba, y otro en honor de América.

The Universal Brotherhood and Theosophical Society

Established for the benefit of the people of the earth and all creatures

OBJECTS

This BROTHERHOOD is part of a great and Universal movement which has been active in all ages.

This organization declares that Brotherhood is a fact in nature. The principal purpose of this organization is to teach brotherhood, demonstrate that it is a fact in nature and make it a living power in the life of humanity.

Its subsidiary purpose is to study ancient and modern religion, science, philosophy, and art; to investigate the laws of nature and the divine powers in man.

Applicants for relief at the Headquarters of the International Brotherhood League, Santiago de Cuba, on the occasion of Katherine Tingley's first visit to Cuba, 1899, bringing food, medicine, and clothing to the suffering and destitute from the ravages of the war.

Necesitados en busca de socorros, delante de la Casa de Socorro de la Liga Internacional de Hermandad en Santiago de Cuba, durante la primera visita de la Sra. Katherine Tingley a Cuba, en 1899, con alimentos, ropas y medicinas para las víctimas de la guerra.

Headquarters International Brotherhood League 1899, Santiago de Cuba.

Casa ocupada por la Liga Internacional de Hermandad en 1899 en Santiago de Cuba.

La Fraternidad Universal y Sociedad Teosofica

Establecida para beneficio de los pueblos de la tierra y de todas las criaturas

OBJETOS

Esta fraternidad es parte de un gran movimiento universal que ha sido activo en todas las edades.

Esta organización declara que la fraternidad es un hecho. Su principal objeto es enseñar hermandad, demostrar que la fraternidad es un hecho natural y hacerla una fuerza viva en la existencia humana.

Sus objetos subsidiarios son: el estudio de todas las religiones, ciencias, filosofía y artes, antiguos y modernos, y la investigación de las leyes naturales y de la divinidad inherente del hombre.

From photograph taken 1901 on board Morgan Line steamer *Excelsior* of Cuban Children from Oriente Province brought to the Râja Yoga School, Point Loma, California, arriving at Point Loma, September 15, 1901. All transportation expenses were paid by Katherine Tingley.

Todos los gastos de viaje fueron pagados por la Sra. Katherine Tingley. De una fotografía tomada en 1901, á bordo del vapor de la línea Morgan *Excelsior*.

The International Brotherhood League

FOUNDED IN 1897 BY KATHERINE TINGLEY

ITS OBJECTS ARE:

- 1 To help men and women to realize the nobility of their calling and their true position in life.
- 2 To educate children of all nations on the broadest lines of Universal Brotherhood, and to prepare destitute and homeless children to become workers for humanity.
- 3 To ameliorate the condition of unfortunate women, and assist them to a higher life.
- 4 To assist those who are, or have been, in prison, to establish themselves in honorable positions in life.
- 5 To abolish capital punishment.
- 6 To bring about a better understanding between so-called savage and civilized races, by promoting a closer and more sympathetic relationship between them.
- 7 To relieve human suffering resulting from flood, famine, war, and other calamities; and generally, to extend aid, help and comfort to suffering humanity throughout the world.

Liga Internacional de Hermandad

FUNDADA EN 1897 POR KATHERINE TINGLEY

OBJETOS

- 1° Ayudar á los hombres y á las mujeres á realizar la nobleza de su ocupación y cual es su verdadera posición en la vida.
- 2° Educar á los niños de todas nacionalidades según los principios más amplios de fraternidad universal y preparar niños huérfanos ó destituidos para que lleguen á ser obreros para la humanidad.
- 3° Mejorar la condición de mujeres desgraciadas y ayudarlas á una vida más elevada.
- 4° Facilitar empleos honorables á los que estén ó hayan estado en prisión.
- 5° Abolir la pena capital.
- 6° Establecer mejor conocimiento mutuo entre las razas civilizadas y las llamadas salvajes, promoviendo entre ellas relaciones más íntimas y más simpáticas.
- 7° Aliviar sufrimientos humanos resultantes de inundaciones, hambrunas, guerras y otras calamidades, y, en general, extender ayuda, alivio y consuelo á la humanidad doliente en todo el mundo.

No man is made happy by the mere possession of objects. The measure of our desires is the measure of our slavery. Only by an acquirement of the science of life can happiness come, and it is only the true philosophy of life which can make man triumphant in the world, the master of the world and of himself.—KATHERINE TINGLEY

No hay hombre que sea feliz sólo por la posesión de objetos materiales. La amplitud de nuestros deseos es la medida de nuestra esclavitud. Sólo la posesión de la ciencia de la vida puede traernos la felicidad; sólo la verdadera filosofía de la vida puede hacer al hombre triunfante, señor del mundo, y de sí mismo.—KATHERINE TINGLEY

Santiago de Cuba.

Orquesta ensayando en la Academia "Râja Yoga,"
Santiago de Cuba.

It depends upon you if the path of the children shall be broad and full of light, or narrow and dark. I repeat, it depends upon you.—KATHERINE TINGLEY

Depende de vosotros si la senda de los niños sea ancha y llena de luz, ó estrecha y sombría. Os lo repito, de vosotros depende.

—KATHERINE TINGLEY

Domestic Economy class, Râja Yoga Academy,
Santiago de Cuba.

Clase de Economía Doméstica, Academia "Râja Yoga,"
Santiago de Cuba.

Let us cast aside creeds and dogmas, and unite as brothers.

It is our privilege to help to lift the thought of the world, to aid humanity by discouraging every barbarism, every inhuman act.

We must help humanity by giving it noble examples of pure thought and right action.

—KATHERINE TINGLEY

Botemos los credos y los dogmas y unámonos como hermanos.

Es nuestro privilegio ayudar á la humanidad exponiéndole lo despreciable de cada barbarismo y cada acto inhumano.

Elevemos á la humanidad dándole nobles ejemplos de pensamientos puros y acciones rectas.

—KATHERINE TINGLEY

Primary class in the Free Râja Yoga School,
Santiago de Cuba.

Clase primaria ó de primera enseñanza en la Escuela libre "Râja Yoga," Santiago de Cuba.

The Theosophic education is not so much a something which is imparted. It is a liberation from the powers of the lower forces which hinder and check a growth which ought to be unchecked and spontaneous.

—KATHERINE TINGLEY

La educación Râja Yoga no es tanto algo que se enseña, como es una emancipación del vasallaje de los poderes de las fuerzas inferiores que impiden y retardan un desarrollo que debe ser libre y espontáneo.—KATHERINE TINGLEY

The power of beautiful expression is not an affair of the intellect, nor of custom, nor convention, nor can it be learned intellectually, nor from books. It comes from the arousing of the inner powers of the Soul which are in sympathy with whatever is high and pure.

—KATHERINE TINGLEY

El poder de expresar la belleza no es cuestión de inteligencia, ni de hábito, ni de convencionalidad, ni puede ser aprendido intelectualmente ni leyendo libros. Proviene del despertar de las fuerzas íntimas del alma que están en simpatía con todo lo que es puro y elevado.

—KATHERINE TINGLEY

Râja Yoga Orchestra in a recent entertainment, Santiago de Cuba.

WHAT IS "RÂJA YOGA"?

Râja Yoga is a very ancient term, and means, literally, "the Kingly Union."

Katherine Tingley, in explaining its meaning, describes it as "the perfect balance of all our faculties, physical, mental, moral, and spiritual—this is attainable."

It implies, therefore, a harmonious development along all lines, without any overstraining or overdevelopment in one direction, at the expense of a deficiency in another.

—RÂJA YOGA ACADEMY PROSPECTUS

¿QUÉ ES "RÂJA YOGA"?

"Râja Yoga" es un antiguo término y significa, literalmente, "La Real Unión."

Katherine Tingley, al explicar el significado, dice que es "el perfecto equilibrio de nuestras facultades, físicas, mentales, morales y espirituales: esto es asequible."

Ello implica, consecuentemente, un desarrollo armonioso en todos sentidos sin recargar ó desarrollar demasiado en una dirección con perjuicio ó menoscabo de la otra.

Company I, New Century Guard—Free Râja Yoga School, Santiago de Cuba.

1ª Compañía, Guardia del Nuevo Siglo—Escuela libre "Râja Yoga," Santiago de Cuba.

Reception at the Râja Yoga Academy, Cuabitas,
April 14, 1906.

The central figure is Dr. Tamayo, President of the Society of Benevolence and Correction. To his right are Katherine Tingley, Hon. Salvador Cisneros Betancourt, President of the Cuban Republic during the war, Hon. Miss N. Herbert; to the left is the Hon. Emilio Bacardí, National Senator. Surrounding these are representatives of the International Brotherhood League, Delegates to the Conference of Benevolence and Correction, and the Râja Yoga boys of Katherine Tingley's party. To the right at the foot of the steps is Miles McAlpin, a representative of the Senior Boys' Club of Lomaland.

Recepción en la Academia "Râja Yoga," Cuabitas,
Abril 14, de 1906.

La figura del centro es el Dr. Tamayo, Presidente de la Sociedad de Benevolencia y Corrección. A su derecha están Katherine Tingley, el Honorable Salvador Cisneros Betancourt, Presidente de la República de Cuba durante la guerra, y la Honorable Nan Herbert; á la izquierda está el Honorable Emilio Bacardí, senador por Oriente. Los demás que rodean, son representantes de la Liga Internacional de la Hermandad, Delegados de la Conferencia de Benevolencia y Corrección, y jóvenes de "Râja Yoga" de la comitiva de la Sra. Tingley. A la derecha y al pié de los primeros peldaños, Miles McAlpin, un delegado del Club de Jóvenes de Lomaland.

THE children of the Râja Yoga School are not only shown the beauty of self-help, but they are also shown the uselessness and the folly of anger and pride and jealousy. They are afforded glimpses of their own natures and are thus taught to discriminate between the higher and the lower, between the real and the unreal. Every essential moral lesson which can be taught to adults can be taught also to children; and surely it is better that the little ones should learn, in the love and sanctity of the home, the lessons which the world has a rougher method of imparting at an age when mental habits have become confirmed.—*Katherine Tingley*

Râja Yoga Academy, Pinar del Río, Cuba, established by Katherine Tingley, September, 1906.

Academia "Râja Yoga" de Pinar del Río, Cuba, fundada por Katherine Tingley en Septiembre, 1906.

The Patio of the Râja Yoga Academy, Pinar del Río, Cuba.

El Patio de la Academia "Râja Yoga" de Pinar del Río, Cuba.

A LOS niños de la escuela Râja Yoga no sólo se les enseña lo bello que es bastarse á sí mismo, sino también lo inútil y lo tonto que son la cólera, el orgullo y la envidia. Se les permite ver vislumbres de su propia índole y se les explica como se aprende á distinguir lo elevado de lo mezquino, lo real de lo ilusorio. Cualquiera lección moral que un adulto puede aprender también se puede enseñar á un niño, y de seguro que es preferible que estos aprendan rodeados del cariño y santidad del hogar, las lecciones prácticas que el mundo imprime con rudos métodos en una edad en cual los hábitos mentales ya están confirmados.—*Katherine Tingley*

THE truest and fairest thing of all, as regards education, is to attract the mind of the pupil to the fact that the immortal self is ever seeking to bring the whole being into a state of perfection. The real secret of the Râja Yoga system is rather to evolve the child's character than to overtax the child's mind: it is to bring out, rather than to bring to, the faculties of the child. The grander part is from within.

The teacher evokes the ideals and fosters them; he points to the path, so that the day comes, in time, when the child finds its place, following instinctively first, afterwards intuitively.—*Katherine Tingley*

A class of Girls in Flower Dance, Râja Yoga Academy, Pinar del Río, Cuba.

Niñas en una clase de baile de flores, Academia "Râja Yoga," de Pinar del Río, Cuba,

Lo más cierto y lo más bello de todo, en cuanto á educación, es encaminar la mente del discípulo hacia el hecho de que el alma inmortal está siempre tratando de elevar al ser, en su conjunto, á un estado de mayor perfección. El verdadero secreto del sistema "Râja Yoga" consiste, más bien, en hacer evolucionar el carácter del niño que en recargar su mente; en

hacer aparecer, mejor que sacar las facultades del niño. La parte más sublime proviene del corazón.

Baskets made by Children of the Râja Yoga Academy, Pinar del Río, Cuba.

Canastillos hechos por las niñas de la Academia "Râja Yoga," de Pinar del Río, Cuba.

El maestro evoca los ideales y los nutre; señala la senda de manera que el día llega, en su oportunidad, cuando el niño encuentra su lugar, siguiéndolo intuitivamente primero, é intuitivamente después.

Katherine Tingley

ONE of the most important features of this system is the development of character, the upbuilding of pure-minded and self-reliant manhood and womanhood, that each pupil may become prepared to take an honorable, self-reliant position in the world's work.

In the very youngest as in the older pupils, the sense of individual responsibility and personal honor is aroused.

The children are taught the importance of the little courtesies of life, and that happiness comes only from trying to make others happy.

Rāja Yoga Academy Prospectus

The Official Reception at the United States Consulate, Santiago de Cuba, to the American and Cuban Commissioners on the occasion of the Dedication of Battle Monuments in honor of Cuban and American soldiers at El Caney and San Juan Hill, February 14 and 15, 1906. The Rāja Yoga Military Company the exclusive Guard of Honor.

La Recepción Oficial al Consulado de los Estados Unidos, Santiago de Cuba, á los comisionados cubanos y americanos, con motivo de la consagración de los Monumentos erigidos en el Caney y Loma de San Juan, en honor de los soldados cubanos y americanos, Febrero 14 y 15, 1906. La Compañía Militar de "Rāja Yoga" fué la única que hizo la Guardia de Honor.

Special Chorus of Junior Girls Singing a Lullaby—Rāja Yoga Free School, Santiago de Cuba.

Coro especial de la segunda clase, cantando un arrullo (lullaby)—Escuela Libre "Rāja Yoga," Santiago de Cuba.

UNA de las más importantes características de este sistema es el desarrollo del carácter, la formación de una mente pura y una confianza propia, viril, en el hombre lo mismo que en la mujer, de modo que cada discípulo esté preparado para tomar una posición honorable y de confianza en las labores del mundo.

En los más jóvenes como en los discípulos mayores se implanta el sentimiento del honor y de la responsabilidad personal.

Se enseña á los niños la importancia que tienen en la vida las pequeñas cortesías y que la felicidad se experimenta tratando de hacer felices á los otros.

Some of the Official American and Cuban Commissioners leaving the Rāja Yoga Academy after the Reception offered them. Group comprises Secretary of the Interior Freyre de Andrade and wife, Gen. Rodríguez, Gen. Rojas, Capt. José Martí, Mrs. Adna R. Chaffee, Miss Helen V. Chaffee, Mrs. S. B. M. Young, etc.

Parte de la oficialidad que componía la Comisión cubana y la americana, al salir de la Academia "Rāja Yoga," después de la recepción ofrecida en esta en su honor. El grupo comprende el Secretario de Gobernación Freyre de Andrade y esposa, General Rodríguez, General Rojas, Capitán José Martí, Sra. Adna R. Chaffee, Señorita Helen V. Chaffee, y Sra. S. B. M. Young, etc.

THE basis of the whole of this education is the essential divinity of man, and the necessity for transmuting everything within his nature which is not divine. To do this no part can be neglected, and the physical nature must share to the full in the care and attention which are required. Neither can the most assiduous training of the intellect be passed over, but it must be made subservient to the forces of the heart. The intellect must be the servant and not the master, if order and equilibrium are to be attained and maintained. In such a system as this it is a necessary part that all service be voluntary, and therefore no salaries are paid.—*Katherine Tingley*

LA base de la totalidad de esta educación es la divinidad esencial del hombre y la necesidad de transmutar todo aquello en él que no es divino. Para hacer esto es preciso no descuidar ninguna parte y la naturaleza física tiene que participar por completo en el cuidado y atención requeridos. Tampoco puede eximirse el más asiduo cultivo de la inteligencia, pero esta debe hacerse subserviente de las fuerzas del corazón. La inteligencia debe ser el sirviente y no el amo, para poder obtener y mantener orden y equilibrio. En un sistema como este es necesario que todo servicio sea voluntario y por lo tanto no se pagan salarios á nadie.

en nombre de la
Fraternidad Universal y Sociedad Teosófica
á la Memoria de los Héroes Cubanos y Americanos
de la guerra de 1898.”

Cavalcade of the Flags of all Nations.

A brilliant part of the Parade.

The Parade from Santiago de Cuba to San Juan Battlefield on the occasion of the unveiling and dedication of the Memorial Archway, November 22, 1908. In the Parade were the following: A squad of mounted police; companies A and C 17th U. S. Infantry with band; 4th Company Cuban Artillery; 3rd regiment Rural Guards with band; Râja Yoga Military Company; cavalcade, Flags of all Nations borne by double file of horsemen; Katherine Tingley, President of the International Brotherhood League; Hon. Sr. Manduley, Acting Governor of Oriente Province; the Secretary of the Provincial Government; Hon. Dr. Grillo, Mayor of Santiago de Cuba; U. S. Consul Holladay; and in carriages, Representatives of the International Brotherhood League; pupils of the Râja Yoga Academy; Hon. Emilio Bacardí; Foreign Consuls of the United States, France, Sweden, Germany, Italy, Venezuela, etc.; the Judiciary; Officers of the Masonic Lodge “Prudence” in full regalia, and about two hundred carriages with the most distinguished and representative men and women of Santiago de Cuba.

Cabalgata con las Banderas de todas las Naciones.

Una parte lucida de la Parada.

Parade de Santiago de Cuba al campo de la batalla de San Juan, con motivo de descubrirse y dedicarse la Portada Conmemorativa, Noviembre 22, 1908. En la parada iban los siguientes: Un piquete de policía montada; Compañías A y C del Regimiento de Infantería décimo séptimo del ejército de los Estados Unidos; 4^a Compañía de Artillería Cubana; 3^{er} Regimiento de la Guardia

Rural con su banda; Compañía Militar de “Râja Yoga”; cabalgata con Banderas de todas las Naciones llevadas por doble fila de jinetes; en automóvil iban la Sra. Katherine Tingley, Presidente de la Liga Internacional de Hermandad, el Sr. Faustino Manduley, Gobernador interino de Oriente; el Secretario del Gobierno Provincial; Hon. Dr. Grillo, Alcalde de Santiago de Cuba; el Cónsul americano Sr. Holladay; en coche, delegados de la Liga Internacional de Hermandad; estudiantes de la Academia “Râja Yoga”; Hon. Emilio Bacardí, senador por Oriente; Cónsules extranjeros, el de los Estados Unidos, Francia, Suecia, Alemania, Italia y Venezuela, etc.; Magistrados; Consejo Provincial, Oficiales de la Logia Masónica “Prudencia” con sus insignias, y unos doscientos coches con las damas y caballeros representantes de lo más distinguido de Santiago de Cuba.

At the laying of the Corner-Stone, November 29, 1908, of the Râja Yoga Academy and the Cuban International Theosophical Headquarters on San Juan Hill Battlefield, which was purchased by Katherine Tingley about two years ago. In the Corner-Stone were placed records and matters of historic interest.

Acto de la colocación de la primera piedra de la Academia "Râja Yoga," y del Cuartel General Teosófico Internacional en Cuba, Noviembre 29, 1908, en el campo de batalla de la Loma de San Juan, adquirido por la Sra. Katherine Tingley hace unos dos años. En dicha piedra han sido encerrados documentos y objetos de interés histórico.

Theosophy is the unifier of religions, because it has no creed —because it imposes no obligation except the service of Humanity and an inward search for God.

La Teosofía es el unificador de las religiones, porque no tiene credo; porque no impone otra obligación que la de servir á la humanidad y de mirar adentro hacia Dios.

The Theosophical Society will open the way to the practical realization of the Brotherhood of all men.

Sheepskin from the Masonic Lodge "Prudence" of Santiago de Cuba, placed in the Corner-Stone of the International Educational Center, laid by Katherine Tingley, November 29, 1908.

La Sociedad Teosófica abrirá el paso á la realización práctica de la Hermandad de todos los hombres.

Pergamino de la Logia Masónica "Prudencia" de Santiago de Cuba, encerrado en la piedra angular del gran Centro de Educación Internacional, que fué colocada por la Sra. Katherine Tingley en Noviembre 29, 1908.

GRAND LODGE OF THE ISLAND OF CUBA. LODGE "PRUDENCE" No. 2.

GREETING: Altruism, unselfishness, is the scattering broadcast of good; to educate and instruct is to make men useful to their country and to humanity, and this is the purpose of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY of Point Loma.

We, the officers of the Worshipful Lodge "Prudence" No. 2, of Santiago de Cuba, constituted under the Most Worshipful Grand Lodge of Cuba, identified with the wholesome doctrines of that worthy and universal institution, wish to leave this record at this solemn ceremony of the inauguration of the

gigantic work which is being erected at San Juan, consecrated to the welfare of the People of Cuba, and which is destined to last through the centuries as will also last the memory of our grateful people.

Santiago de Cuba, 22nd November, 1908.

*The term education . . .
means no less than the de-
velopment of the Soul, with
all the capacities which be-
long to it.*

—KATHERINE TINGLEY

*La palabra educación . . .
significa nada menos que el
desarrollo del alma, con todas
las capacidades que le pertene-
cen.*

—KATHERINE TINGLEY

Raising the Cuban Flag at the Râja Yoga School.
Izando la bandera cubana en la Escuela "Râja Yoga."

Seeing that the children of today will be the men and women of the future, the great importance of this work surely cannot be over-estimated. Only by wise teaching, by training and self-reliance, self-discipline, concentration, and a recognition of the power of silence, can the lower qualities of the nature be overcome and the highest be developed, so that the children who are brought in touch with this Movement shall in their turn become practical workers for humanity. One of the great objects must be to bring home to their minds the old, old teaching that they are immortal souls, not divorced from beneficent Nature, but in deed and in truth a part of it.

—KATHERINE TINGLEY

At home in Lomaland

Five of the eleven Cuban children who became famous through the persecution of Katherine Tingley by the Gerry Society.

En el hogar en Lomaland.

Cinco de los once niños cubanos, célebres debido á las persecuciones llevadas á cabo por la Gerry Society, contra Katherine Tingley, al arribo de estos á Ellis Island.

Little girls in a Japanese dance in the Patio of the Raja Yoga Academy, Pinar del Río, Cuba.

Niñitas en una danza japonesa en el patio de la Academia "Râja Yoga," Pinar del Río, Cuba.

En vista de que los niños de hoy serán los hombres y las mujeres del porvenir, no es posible exagerar la importancia de estos trabajos. Sólo la sabia enseñanza, la instrucción práctica, la confianza en sí mismo, la disciplina propia, la concentración y el reconocimiento del poder del silencio, pueden subyugar las cualidades bajas y desarrollar las elevadas, de modo que los niños que toman contacto con este Movimiento vendrán á ser á su vez obreros prácticos en pro de la humanidad. Uno de los grandes objetivos debe ser imprimir en sus mentes la viejísima lección, que son almas inmortales, no divorciadas del resto de la benéfica Naturaleza, sino en realidad y en verdad parte de ella.

—KATHERINE TINGLEY

Alumnos cubanos de la Academia "Râja Ycga," Point Loma.

Hear me, my brother, There are three truths which are absolute, and which cannot be lost, but yet may remain silent for lack of speech.

The soul of man is immortal, and its future is the future of a thing—whose growth and splendor has no limit.

The principle which gives life dwells in us, and without us, is undying and eternally beneficent, is not heard or seen, or smelt, but is perceived by the man who desires perception.

Each man is his own absolute lawgiver, the dispenser of glory or gloom to himself; the decreer of his life, his reward, his punishment.

These truths, which are as great as life itself, are as simple as the simplest mind of man. Feed the hungry with them.

Escuchadme, mis hermanos. Hay tres verdades que son absolutas, y que no pueden perderse, y sin embargo quedan silenciosas por falta de lengua que las exprese.

El alma del hombre es inmortal, y su porvenir es el de una cosa cuyo crecimiento y esplendor no tienen límites.

El principio que da la vida reside dentro de nosotros; es inmortal y eternamente benéfico; no es percibido por el oído, ni por la vista, ni por el olfato; sólo es percibido por el hombre que desea obtener la percepción.

Cada hombre es su propio y absoluto legislador; el dispensador de gloria ó de oscuridad á sí mismo; el dictador de su vida; el concedente de su recompensa y su castigo.

Estas verdades, que son tan grandes como la vida misma, son á la vez tan sencillas como la inteligencia más simple entre los hombres. Alimentad con ellas á los hambrientos.

IDILIO DEL BLANCO LOTUS

THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, founded by H. P. Blavatsky at New York, 1875, continued after her death under the leadership of the co-founder, William Q. Judge, and now under the leadership of their successor, Katherine Tingley, has its Headquarters at the International Theosophical Center, Point Loma, California.

This Organization is not in any way connected with nor does it endorse any other societies using the name of Theosophy.

Photograph, taken May 15th 1909, of all Cuban boys from Santiago de Cuba, now attending the Raja Yoga School at Point Loma, California. This group shows (after 8 years at Point Loma) seven those of who came in 1901.

Fotografía tomada en Mayo 15 de 1909, de todos los muchachos de Santiago de Cuba, ahora en la Academia "Raja Yoga" de Point Loma, California, incluyendo siete, después de ocho años, de los que vinieron en 1901.

LA FRATERNIDAD UNIVERSAL Y SOCIEDAD TEOSÓFICA fué fundada por Madame H. P. Blavatsky en 1875, continuó después del fallecimiento de ella, bajo la dirección del cofundador Señor W. Q. Judge y está hoy dirigida por su sucesora la Señora Katherine Tingley, teniendo su Cuartel General en el Centro Teosófico Internacional, Point Loma, California, Estados Unidos de América.

Esta asociación no afilia ni apoya ninguna otra sociedad que use el nombre de Teosofía.

THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY welcomes to membership all who truly love their fellow men and desire the eradication of the evils caused by the barriers of race, creed, caste, or color, which have so long impeded human progress; to all sincere lovers of truth and to all who aspire to higher and better things than the mere pleasures and interests of a worldly life, and are prepared to do all in their power to make Brotherhood a living energy in the life of humanity, its various departments offer unlimited opportunities.

Group of all Cuban girls from Santiago de Cuba at the Raja Yoga Academy, Point Loma, (including three of the group arriving Sept. 15, 1901). Photograph taken May 15, 1909.

Grupo de todas las niñas de Santiago de Cuba en la Academia "Raja Yoga," Point Loma, (incluyendo tres de las que vinieron en Septiembre 15, 1901). Fotografía tomada en Mayo 15 de 1909.

LA FRATERNIDAD UNIVERSAL Y SOCIEDAD TEOSÓFICA admite cordialmente como miembros á todos aquellos que realmente amen á sus prójimos y deseen la eliminación de los males resultantes de las divisiones de raza, credo, casta y color que tanto y por tan largo tiempo han impedido el progreso humano; á todos los amantes sinceros de la verdad y á todos que aspiran á algo mejor y más elevado que los meros placeres de la vida social y están prontos á hacer todo lo posible para que la Fraternidad sea una fuerza viva en la vida de la humanidad; á todos estos sus diferentes departamentos ofrecen oportunidades sin límites.

Art Music Literature and the Drama

Prehistoric Tumuli in Ireland

IN a richly wooded country, within easy reach of Dublin and almost under the shadow of Tara, the ancient seat of the high kings of all Ireland, we find the three principal tumuli of a lost civilization. These impressive and mysterious structures, whose designers are unknown, and whose purpose is misunderstood by the modern archaeologist who knows nothing of the mysteries of the Ancient Wisdom, are situated in the antique Royal Cemetery called the Brugh-na-Boinne, and are surrounded by numerous smaller companions, tombs.

The resemblance between this Field of the Dead on the left bank of the Boyne river, and the famous necropolis on the left bank of the Nile, in which the three greater Egyptian pyramids pierce the blue with their flame-points, is of considerable significance to the student of Theosophy, for there is an obvious parallel in more ways than one. "New Grange," the largest of the Irish "pyramids," as we may call them without too great a strain on the imagination, bears the strongest resemblance of the three to the great pyramid of Khufu or Cheops in its internal arrangements. As a skilful piece of mechanical work it is remarkable, for the stones covering the entrance passage are enormous in size; one of them measures 17 feet by 6. The entrance to this passage is marked by a great stone 10 feet long, carefully carved in a peculiar manner, the meaning of which is not suspected by archaeologists who take them as decorations. The passage itself is 63 feet long; about 20 feet from the entrance there is a sudden narrowing or obstruction through which it is difficult to squeeze. Beyond this the way is easier and ultimately it widens into a large domed chamber with three recesses, in two of which there are large blocks of granite slightly hollowed out. An obelisk is said to have once stood in the center under the dome.

The other tumuli (Dowth and Knowth) bear a general resemblance to New Grange but differ in detail. In the annals of Ulster we read that in the year 62 A. D. these "caves," as the chroniclers call them, were rifled by the Danes, so it is impossible to prove that the few calcined bones, glass, bronze, and other articles found in some of them were placed therein by the original builders.

The conventional and popular opinion of archaeologists is that these tumuli were intended only for tombs, but to the student of comparative religions and the mysteries, in

the light of H. P. Blavatsky's *Secret Doctrine*, this is more than improbable, though they may have been used for burial at some period subsequent to the age in which they were put up. The obstruction in the main passage, which would be an inconvenient hindrance to the carrying of a body, the shallowness of the so-called sarcophagi which are not deep enough to contain one, and the obviously symbolic nature of the carvings within the recesses — *where they serve no possible decorative purpose*, for they are hidden in obscure places — all point to a much more important use, i. e., that of initiation into the mysteries. These tumuli can have been nothing less than the central features of a racial period when the most sacred rites were enacted.

In the archaic legends New Grange is called

More beautiful than all beauty was his form,
His dress was ornamented with gold,
And he held a silver tiompan in his hand,
Of red gold were the strings of that tiompan,
And sweeter than all music under heaven
Were the sounds upon the strings of it;
A wand of melody sweet an hundred fold,
Over it were two birds.

This brief study of Irish tumuli would be inadequate if we did not glance at the relation between them and those to be found as well in various other countries. With regard to the great and mysterious tumuli near the river Boyne, it is not perhaps surprising to learn that in other countries not very far away similar structures are found whose purpose and origin, if the truth be told, are equally obscure, but which, of course, are popularly supposed to be merely tombs. There is a

remarkable one at Gaur Innis, Giant's Island, in Brittany, which is covered with inscriptions of symbols quite similar to those in Ireland; and near Kirkwall, in the Orkney Islands, north of Scotland, there is an immense tumulus called Maeshowe, closely resembling the New Grange, Dowth, and Knowth tumuli in Ireland. Maeshowe is 36 feet high, and has the usual long passage (50 feet long) leading to a central chamber with three side rooms.

STUDENT

Some Legends

of the Maoris

WITH but few exceptions the legends of the Maoris have refinement and beauty. There is one which gives a symbolic picture of the

initiation of a soul into compassion through the doorway of suffering. It tells of Niwatreka, a beautiful Maori maiden, who, though deeply loving her husband, is unable to bear his delight in bloodshed and cruelty. So she takes up her abode among the shades of the nether world. Her husband, noble at heart, is so grief-stricken at her loss that he willingly undergoes the greatest sacrifice and suffering in order to pass into the other world and redeem her from the shades. Through this suffering his whole nature is changed and from being a bloodthirsty tyrant over his people he becomes a compassionate ruler.

Another legend is of a daughter of the sky who weds an earthly husband. But he fails to understand the opportunity that is his, and instead of trying to rise to her heights he ignorantly tries to drag her down to his level. She returns to the sky and her husband is only able to regain her love by climbing upwards to her. Such legends are allegories of the pathway of the human race. STUDENT

GREAT TUMULUS CALLED MAESHOWE
NEAR KIRK WALL, ORKNEY ISLAND, SCOTLAND

From THE SEA LIMITS

LISTEN alone beside the sea,
Listen alone among the woods;
Those voices of twin solitudes
Shall have one sound alike to thee;
Hark where the murmurs of thronged men
Surge and sink back and surge again,—
Still the one voice of wave and tree.
Gather a shell from the strown beach
And listen at its lips; they sigh
The same desire and mystery,
The echo of the whole sea's speech.
And all mankind is thus at heart
Not anything but what thou art;
And Earth, Sea, Man, are all in each.

Dante Gabriel Rossetti

the dwelling of a god, Angus Og, the Gaelic Apollo or Balder, who wandered through the world playing strange music. He is described by a King of Tara in these words:

There appeared to me upon the brow of Tara
A splendid youth of noble mien,

Kill out doubt which rises within. That is not yourself—you know.—*Words of a Teacher*

THERE is a small fox terrier at Point Loma with many qualities of devotion and gratitude that are quite beyond those exhibited by average humanity. It has likewise some foibles that many humans must confess to showing. With the alert hunting instincts of his kind liable to die of inanition in this peaceful place, where the birds have not known the sound of a gun in many years, and where even the predatory rabbit is kept in place and the gardens protected by nothing more unbrotherly than a fence of wire netting, this small dog spends a goodly part of his time searching for excitement. When other things fail he sometimes goes to the top of the wild flower garden, plants himself squarely in the upper path, facing south, and with the air of a Don Quixote gives one sharp bark. Quickly an answering bark is heard and the vocal battle soon wages warm. The answering bark is merely an echo thrown back from the broad front of the Industrial Building just south of the garden. But the small dog does not know that, and doubtless in his doggy brain is something that warms convinced of the inspiration of a knightly mission in life.

Is not a very human tendency mirrored in the antics of this restless little dog? How many of us, about once in so often, must—simply *must*—stir up some old mental echo, of our own or another's creation, and then set out to argue it into silence, to beat it by our dear, courageous, personal and limited protests? And how do all these protests, so absurd and gratuitous, serve to make us feel that we are great warriors, such strong souls doing battle against—what? In nine cases out of ten, against a nothing-at-all, a delusion, an outworn notion or misconception, an echo merely.

There is an old, old script, so old that the Hebrew Scriptures are as yesterday's print beside it, from whose record of wisdom H. P. Blavatsky translated many paragraphs for the

BARKING AT ECHOES

use of disciples. One of these refers to the wild antics of the mental self when the soul-light, the discriminating power, is dimmed or quenched:

And then, O thou pursuer of the truth, thy Mind-Soul will become as a mad elephant that rages in the jungle. Mistaking forest trees for living foes, he perishes in his attempts to kill the ever-shifting shadows dancing on the wall of sunlit rocks.—*The Voice of the Silence*

WOMANHOOD

SO gentle and so bounteous doth appear
My lady, when she maketh a salute,
That every tongue, trembling, becometh mute;
The eye to look upon her doth not dare.
Though conscious that her praise pervades the air,
In beauty clothed, she moveth modestly,
As if she were a being from on high,
Come down to earth to show a marvel here,
So grateful seems the vision from above,
The heart drinks sweetness from the entranced eye
Which would mock Fancy if it were not proved;
And from her lips it seems as there were moved
A delicate spirit, breathing full of love,
Which ever biddeth the rapt soul to sigh.

Dante, translated by G. W. R. (Selected)

The great battle is against that unseen besieging army, the progeny of our own and others' thoughts, that ever whirls and surges about the door of mind, seeking, forcing entrance, to spread as far as permitted, destruction and despair. Our own thoughts and the thoughts of others—those wicked inspirers of despair and fear when they would be bringers of joy instead had not humanity so pitifully failed in the doing of the real, the inner, work—it is these which we invite into our minds, or allow to come in, from restlessness and ignorance far more often than from

wilful bad intent. Yet they are only echoes; echoes of our own past thoughts and acts, and those of others. Why stir them up at all? Why stop to argue with them when, in an unguarded moment, they force their way into the citadel of mind? It is as silly a process as the barking of that little dog, and for all our boasted "warrior attitude" and the brave battle we put up, the waste of time is absurd, the uselessness of all that effort patent enough when we stop to think of it.

If we understood our own natures even to a degree we would have the power to discriminate between what are echoes merely and what are our real foes. And we would have plenty to do in confining our attention to the latter. Worlds of energy now wasted would be saved, and, which is more to the point, we should get somewhere in the end.

What is insanity, among other things, but an inability to tell the true from the false? And quite apart from Theosophy, which alone of all philosophies and sciences can throw light upon the constitution of the mind, we have the testimony of physicians that thousands are yearly pushed over into the abyss of insanity from such seemingly simple beginnings as harboring an imaginary grievance, worrying over some slight until its imagined self is a thousandfold larger than the real slight ever was, in short, barking away at echoes.

The wise Student, which means one who is working along sane and sensible lines, early learns to conserve his energies, to let the past take care of itself, to let the echoes lie in their proper state which is a dormant one, to dismiss at once every idea that starts up an inside fever for self-justification, for recognition, for praise or flattery, for anything that serves to disturb.

The "Gate of Balance" can only be unbarred by one whose hand is strong enough resolutely to brush aside everything, no matter

how honeyed or how distressing to the personality, that tends to delude, blind, and disturb, and whose perceptions are so keen that these echoes, these vagrants of the inner realms, are at once seen to be what they are and simply ignored.

The wise student holds to quiet, to calmness, to the firm, unbroken and golden thread of duty, expending his energies on his duties, not on personalities nor grievances, nor echoes. One's own duty, however simple, is always enough if it be done rightly, for all things are of the Law.

There are plenty of battles all along the road that winds up the Purgatorio Mount; we do not have to go back and down into the Inferno to get our share of horrors and sights and enemies to do battle with. STUDENT

Juliana van Stolberg

THE birth of a little daughter to Queen Wilhelmina and the Prince-Consort of Holland, and more particularly the christening of the child as "Juliana," have again directed attention to the great ancestress after whom the little Princess was named. It is said to have been the Queen's desire, in so doing, to honor the memory of a remarkable woman, one who was of most noble, unselfish life, and whose influence was positive and direct upon the history of her own House and also that of the Netherlands.

Juliana van Stolberg was the mother of Prince William of Orange, the real propelling force behind the struggle that finally freed the Netherlands from Spanish domination and the horrors of the Inquisition. Ostensibly in the background she was yet foremost in her real influence upon her son and the statesmen of her day.

One historian says that Juliana van Stolberg may rightly be called the conscience of the Prince. It was she who urged and aided his brothers and sisters to serve as co-warriors and faithful allies, and it was she who, during times of bitterest struggle, of almost utter discouragement, continually besought the Prince never to compromise, never to give up the cause, never to sacrifice even the thought of right and victory for expediency or through fear.

She became old before Dutch freedom was established, and poor because of her sacrifices for it. Through blindness she became unable longer to guide the pen herself, that pen which had served and inspired the cause of liberty—as did Thomas Paine's the principles at stake in America's great struggle to be free. Yet even then, by the hand of a clerk, she continued to admonish her son to hold to right, to freedom, to altruism, to the highest good, regardless of suffering or assault.

No records in the history of Holland are more touching than the letters which she wrote to her illustrious sons in the times of their direst need, those critical times when the fate of nations hangs in the balance and when the weight of a word has been known to turn the scale.

In a letter which she wrote to her son Lewis, who was acting as commander of the forces under William of Orange, she said:

With anxiety I see the dangers that surround you. Consider nothing, do nothing, that might be against the Word of God, against the well-being of your soul, against the interests of the country or its inhabitants.

At a later time when the ecclesiastical enemies of Holland were using every device to induce William to accept a seemingly honorable peace, yet one that would compel the sacrifice of absolute freedom of conscience, and not long after she had passed through the unspeakable grief of seeing her noble Adolphus, her chivalrous Lewis, and her beloved Henry, her youngest born, sink into bloody graves in heroic defense of principle, she wrote to her eldest son, the Prince:

My heart is longing after reliable tidings from my Lord, for as I think, the peace now in prospect will prove injurious to the freedom of the soul

Lomaland Photo. and Engraving Dept.

JULIANA VAN STOLBERG

MOTHER OF WILLIAM OF ORANGE. (FROM AN OLD PORTRAIT)

and conscience. I trust my dearly loved Lord son will be supported by the grace of God to do nothing against God and the blessedness of his soul, for it is better to lose the temporal than the Eternal.

Though her thought was clothed in a theological garment, as almost of necessity must have been the case in her day, it is easy to see behind the letter "the spirit that giveth life."

The birthday of the little Princess Juliana, April 30, witnessed an outflow of enthusiasm and patriotic feeling such as no Hollander can remember having witnessed before, not even at the birth of the present Queen. The tie which for so many years united Holland to the House of Orange was recognized to be thus immeasurably strengthened and it seemed as though the people, with one acclaim, pledged themselves anew to the principles so gloriously defended by that high and noble house.

"*Nomen est omen.*" May the baby Princess hold to the high ideals of her House, and, if need be, battle for them as valiantly as did her noble ancestress. A DUTCH STUDENT

Jottings and Doings

(From a Student's Note Book)

ONE of New York's wealthiest young women has taken possession of one of her father's ferry boats and fitted it out for a floating tuberculosis hospital for the poor. There will be accommodation for three hundred patients, with special arrangements favoring children. Milk, eggs, fruit, and fresh vegetables will be furnished from the farms belonging to the donor's father, and what with nurses and physicians in attendance on board, sunshine and sea-air, in all likelihood that touch of brotherliness and compassion which is often more healing than drugs, this floating hospital must become a potent center of helpfulness. And we asseverate that this young woman will not suffer from *ennui* nor will the paths leading to disappointment if not suicide, and which are so often traveled by the idle rich, present any attractions to her. A life, nay, even a single act, is so powerful for good or for ill. The opportunities of existence, the sacredness of life in its every phase—how little do we seize the one, how seldom do we realize the other!

As the result of the passage of a special ordinance by the Common Council of Chicago, the women inspectors of the police department—of whom there are six—will henceforth go about their duties clad in uniforms. These are neat, attractive, and although simple to a degree are wholly feminine in tone. The only feature, in fact, which would suggest to the lay mind that they were uniforms at all is a black band worn upon the sleeve, on which is inscribed in gold letters "Health Department Inspector."

THE battle against tuberculosis is being nobly waged on behalf of Ireland by the Countess of Aberdeen. As President of the Woman's National Help Association of Ireland she has been carrying on an active campaign against this fearful disease which finds such favorable conditions for its fatal propaganda among the undernourished and ignorant peasantry. Although the Countess began her work but a year ago three sanitariums for the cure of this dread evil are already in operation. She recently said:

Against a wet climate, a low dietary and a scanty fuel supply the poorer people of Ireland have sought warmth by shutting off ventilation. The results have been lamentable. There are 11,000 victims a year, and the disease has a grip on 120,000 of the population.

QUEEN ALEXANDRA of England, whose wondrously beautiful wild flower garden has been described in these columns, has recently designed new flower gardens at Sandringham. Shrubbery and ornamental trees form a large part, while, as a matter of course, there are included in the general landscape plan large beds of the Queen's favorite flowers, roses and violets. The lawns and gardens of England are unique in their dignity and beauty, while the supervision, and even the actual care of them, is often the favorite occupation of those who belong to the highest social class.

OUR YOUNG FOLK

THE CITY TREE

I STAND within the stony, arid town,
I gaze forever on the narrow street,
I hear forever passing up and down
The ceaseless tramp of feet.

I know no brotherhood with far-locked woods,
Where branches burgeon from a kindred sap,
Where o'er mossed roots, in cool, green solitudes,
Small silver brooklets lap.

I see no flowers, but as the children race
With noise and clamor through the dusty street,
I see the bud of many an angel face,
I hear their merry feet.

No violets look up, but, shy and grave,
The children pause and lift their crystal eyes
To where my emerald branches call and wave
As to the mystic skies.

Isabella V. Crawford (Selected)

A Word in Season

MRS. Carisbrooke was feeling troubled; Bennie was not doing as well at his office as she had expected. Complaints about his carelessness had come again, and as the mother looked across the table at her handsome high-spirited son, her heart sank. The father was away in another State, striving to make a home for them there, and any day might mean success—but meanwhile! Her face grew sad, and she sighed, as she helped the little girls to their tea. Isobel was six and Muriel was three, and very fond of each other they were; indeed so close was the tie of affection between them all, that Mother's sadness stilled their usual merry chatter and Muriel's big eyes fastened themselves upon their mother. Ben had an uncomfortable feeling that things were not as they should be, but pushed it aside with an irritable excuse to himself—"I can't help it; a fellow must have a little fun sometimes; old Dodds is too particular."

What was best to be done, she wished she knew, for how dear all her darlings were to her! She looked at her little girls, and as she looked she wondered what Râja Yoga would have to say about the present situation. She felt glad her girls had got the chance her son had missed, for they went to the beautiful Râja Yoga School newly opened in their city.

Did the little one catch her thought? For in the silence, you know, our hearts are very close to those we love, and out of the silence she spoke in her emphatic, earnest little way, her eyes fixed on her mother's face: "*There is a Mighty Power, that do be in us all.*"

Involuntarily both mother and son repeated it silently, "There is a Mighty Power, that do be in us all," and in the hush that followed they looked each other in the eyes and there was no need for words, Râja Yoga had set the equation, and there only remained the doing of it.

"Bless you, my treasure," said Mother as she bent and kissed Muriel, "and thrice blessed be Râja Yoga."

"Who is going to play chasings?" asked

Lomaland Photo. and Engraving Dept.

CELEBRATING THE BIRTH OF THE PRINCESS, IN GRONINGEN, HOLLAND

Ben. "I" and "I" was the delighted response that chased away for ever the shadow thoughts that "Ben was too big to play with them now, and that Mother could not be merry as she used to be."

And would you believe it? the clouds were driven away. In a few weeks time Mr. Carisbrooke found a situation in the very city they were then living in, and Isobel and Muriel rejoiced that they could continue to go to the beautiful Râja Yoga School that teaches people how to be useful and happy. ETHNE

St. Patrick's Well

DID you ever hear of a well with stair-steps in it? There is such a one in Italy, in the town of Orvieto and instead of letting down a bucket on the end of a rope, the people walk down into the well themselves, leading their donkeys behind them, and load their backs with water at the bottom. This is called the well of San Patrizio (known in Ireland as St. Patrick) and it is the largest one in the world. It is cut through the solid rock 203 feet deep, and is 43 feet wide, and surrounded by two spiral staircases that lead to the bottom. The people go down one way and come up the other, so that there is never any passing.

Orvieto is a very ancient town, surrounded by a wall and perched upon a steep hill. Before this well was made in the 16th century, the citizens had to toil up and down the long hill for their water, and when their town was besieged, they would have to surrender or die of thirst. So they dug the well of San Patrizio inside the city walls, and it had to be very deep to reach through the lofty rock on which their town was perched, to the water beds below. It is quite cold at the bottom, and as faintly lighted as the innermost recesses of the caves of Point Loma. B. McC.

Rejoicings in Holland

GLAD indeed were the hearts of the people in Holland when their little Princess was born last spring. The Hollanders love their Queen and their dearest wish was for an heir to the throne who should follow in her footsteps. On April 30, the day the royal baby was born, there were festivities all over the country. The people were like a happy family. The cut on this page gives a glimpse of the celebration in Groningen, as it was seen from the entrance of the burgo-master's house. On another page of this paper you will find a picture of the mother of William the Silent, Holland's greatest patriot. JACQUELINE

"Why, good morning, Mr. Blackbird," Elsie said, with a little jump, "I didn't expect you to come quite so suddenly."

"Didn't you?" the blackbird said, with his funny squawk of a laugh. "What is it that makes you so happy today?"

"You can't think, Mr. Blackbird," Elsie said, "Mother is going to teach me to cook and to sew, this vacation, and she says I can be of much help if I will try; and now I am making an apron to wear," and Elsie spread out a little blue gingham apron, all finished but the button holes.

"That is what you put on when you cook, is it? Why of course it is just the kind of a garment the old woman was hanging out when a distant cousin of mine nipped off her nose. You probably have heard that story."

"Oh, yes," said Elsie, laughing. "Did you have any relatives baked in that famous pie?"

"Sing a song o' sixpence," of course I did," he answered, "but to return to the apron, it seems to me that it is the very thing you needed to make you happy, because you will be a useful, helpful girl whenever you wear it. It is really more fun than playing all the time or being unhappy wanting things, isn't it?"

"Wanting things does make me unhappy. I tried it again, but as soon as I made up my mind that I really didn't want anything I was happy once more. It isn't worth while," Elsie said.

"But being useful and busy is worth while because it makes others happy as well as yourself," the bird replied. "The first thing you know, you will begin to find out who you are. There is no better way of finding out who you are than being useful to others."

"I am glad," Elsie answered, "to learn how to find out who I am, because this not knowing is quite bothersome."

"Keep on being useful and not wanting things you don't need, and some day you will

be surprised to find out who you really are. Good bye," and the blackbird flew away with a merry whistle.

EUGENIA

How Cane Sugar is Made

IN the central part of Cuba—the province of Santa Clara—several of the largest and best equipped sugar factories are owned by the Abreus, relatives of Marta Abreu, the Cuban benefactress. A visit paid to one of these was doubly interesting and instructive owing to Señor Abreu's own enthusiasm. He proves how much heart he puts into his work by his manner of showing and explaining the different processes and methods, also by living quite near to his factory.

The cane, in variety of shape and size, straight or crooked, is cut into three or four foot lengths and arrives at the factory stacked on wagons. To an inexperienced eye it might be just dried sticks for fuel. It is tumbled all together into a shallow pit; from there gradually raised—at the same time crushed—to a platform or resting-place, where the first separation is effected. The refuse is carried off to feed the great furnace that supplies the steam power; the remaining cane is passed on and up—watered and skimmed on its way—to another stage, where again the refuse, showing now as scum on the sur-

face of the great boilers, is taken off, pressed, and used, some as land fertilizer, some as fuel.

Again and again it is boiled in circular vats until the sugar cane forms itself into crystals. The refuse is now molasses or treacle. At certain stages this brown sugar is run off for use, into sacks; the rest is carried on and still up to be further purified, and when finished is of a pretty, uncommon yellow color, showing by its gleaming crystals the sunshine it has absorbed while growing as the cane. The flavor is pure though not very sweet. If a white sugar is required the yellow is usually sent to other countries for further refinement.

This estate was owned by Señor Abreu's father, but everything was destroyed during the war, and the present factory is modern and has the latest machinery, with both electrical and steam power.

F. J. B.

THE good is but the beautiful in action.—*Milton*

PRACTISE trust with self-exertion.—*Persian Proverb*

MANNERS are the happy ways of doing things.—*Emerson*

No fountain is so small but that heaven can be mirrored in its bosom.—*Hawthorne*

All profits arising from the business of the Theosophical Publishing Co. are devoted to Humanitarian work. All who assist in this work are directly helping that cause.

THE MYSTERIES OF THE HEART DOCTRINE

PREPARED BY
KATHERINE TINGLEY
AND HER PUPILS

The Theosophical Book *of the* Twentieth Century

Tells the story and the history of the Theosophical Movement.

The prices are \$2 in cloth and \$1 in paper, which barely cover the cost, for it is printed and bound, not gaudily, but with such carefulness and thoroughness of art and craft as to make it unique among modern edition books.

ORDER FROM THE
THEOSOPHICAL PUBLISHING CO., POINT LOMA, CAL.

Isis Conservatory of Music OF THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY POINT LOMA, CALIFORNIA

Personal applications and inquiries received every Saturday
by the Secretary at SAN DIEGO BRANCH

ISIS HALL, 1120 FIFTH STREET

between the hours of 9 A. M. and 4 P. M. Full particu-
lars will be sent by mail upon application to

J. H. FUSSELL, SECRETARY AND TREASURER,
ISIS CONSERVATORY OF MUSIC, Point Loma, California

SOME OF THE ERRORS OF CHRISTIAN SCIENCE CRITICISM

BY H. P. BLAVATSKY AND WILLIAM Q. JUDGE

CONTENTS

"The Empty Vessel Makes the Greatest Sound"
A Note of Warning

—by H. P. Blavatsky

Of "Metaphysical Healing"

Affirmations and Denials

The Cure of Diseases

Replanting Diseases for Future Use

—by William Q. Judge

A MOST VALUABLE PAMPHLET. Outside of Theosophy there is given no adequate explanation of the healing that is at times accomplished, nor of its *rationale*, nor of the ultimate price that must be paid and the dangers connected with such practices.

This pamphlet is invaluable to all students.

Evolution and the Jewish "Genesis" Story

ATTEMPTS to reconcile science and the literal creation story in *Genesis*, says a writer, very truly, are absurd; no such reconciliation is possible, nor is it called for. The man who tries to reconcile geology with *Genesis* should first set about reconciling *Genesis* with *Genesis*. For, while the first chapter tells us that vegetation was created on the third day and man on the sixth, the second asserts that man was made before vegetation and that there was no vegetation before man because there was no man to till the earth.

This shows how careless must be the reasoning which can pretend to reconcile science with an account which contradicts itself. The geologist must have sought to reconcile geology with certain isolated statements in *Genesis*, for clearly he could not reconcile it with all; and one may ask what would be the use of reconciling science with part of the Jewish creation-story while leaving the other parts unreconciled? Evidently nothing is gained.

The key to the Jewish *Genesis* creation-stories is supplied by reference to ancient creation symbology in general, a study of which is essential for the scholar who seeks to arrive at the truth in the matter. Our geologist would scarcely limit his geological studies to the rocks of one country if the rocks of other countries were available for examination nor base his conclusions with regard to palaeontology on the evidence afforded by one small locality. Why, then, should he base his conclusions as to creation allegories on the evidence furnished by the Hebrew scriptures (in the form handed down to us) alone? Available literature supplies us with many other creation allegories; and by comparing those found in the inscriptions of Babylonia, the records of India, the Scandinavian mythology, and the Red Men's folk-lore, we can obtain comprehensive views and side-lights and eliminate non-essential features and accidental modifications.

An application of this scientific method of research shows that in *Genesis* there are two separate creation stories confused together.

Man and His Various Creators

Man was first developed, say the ancient accounts, as a highly evolved animal, "mindless," devoid of the divine spark. This is narrated in chapter ii, where Jehovah creates man out of the dust of the ground, breathing into his nostrils the breath of life, so that he becomes a "living soul" (*nephesh*, in the Hebrew, meaning "animal soul"). The formation of man was completed when he received the light of

mind, which was imparted to him by certain high spiritual beings who had been men in a previous cycle, and who are called in the Hebrew account *elohim*, "gods," or "spirits." This is referred to in the first chapter, where the *elohim* say, "Let us make man in our image, after our likeness."

The above interpretation is not fanciful, for it is derived, as said, from a study of ancient symbology in general, although the *Genesis* account itself supports it. There are many other important points in connexion with the proper interpretation of this "Book of the Beginnings," into which, however, it is obviously impracticable to enter here; nor is it necessary to do people's studying and thinking for them.

The several attitudes taken up by modern thought with regard to the *Genesis* stories do but little credit to our sagacity. On the one hand the theological acceptance of this much-mutilated allegory as a literal account is worthy only of the superstitious credulity of a tribesman; but on the other hand the attitude of secularism is equally intemperate. And both attitudes reveal, by their extravagance, the ignorance upon which they are based. For no scholar adequately informed in his subject could either accept or reject in their entirety these stories. They are not verbally inspired Gospel; nor are they mere fables or guesses. A slight acquaintance with the literature of the subject amply proves this. By examining the allegories and myths preserved from other sources we find that such general accounts are universal; and their identity as to essentials, coupled with their differences in details, proves their derivation from a common source. This

conclusion, the judgment of impartial reason, should lead the well-ordered mind to ask the question, "What was that source?" But, conformably to a usage that may be expected but not condoned, many people have preferred to suffer the strict course of logic to be deflected by their prejudices, and to beat out a track to the conclusion they wished to reach rather than follow the road whither it leads.

Since evolution (materialistic as opposed to spiritual) chances to be the word with which to command respect in scientific circles today, historians, anthropologists, philologists, and even theologians, having respectfully kowtowed before it, one may invoke its magic power in the present case. When modern science (re-)discovered evolution, they found (so to say) a piece of the robe of the Almighty; but they used it as a dressing for

puppets of their own and refrained for the time from seeking to find more of the fabric. But Theosophy does not need to borrow, nor to bow down before the particular popular brand of evolution; for it has only to point to the ancient records in order to show that Evolution has been recognized from time immemorial to be the great underlying law of the universe. But while modern science has so far remained content to trace out one or two minor threads of the fabric, ancient knowledge had a more comprehensive view. By it, evolution was traced not only in the kingdoms of physical nature, but in those less external and more real realms wherein operate the powers that are causal to the phenomenal world.

**Evolution Far
More than a
Physical Fact**

The ancient mythoi, of which the Bible story is one, were symbolic records of the evolution of worlds and of all animate beings, from the mineral to the man, and beyond the mineral and man in both directions. These records were originally compiled by Initiates in the Sacred Knowledge, in times when that Sacred Knowledge was more generally recognized among men than it is in this present cycle. Containing, as they thus do, the imperishable seeds of Truth, they have been enabled to exist all through the succeeding dark ages; and men repeat and repeat them, unwilling to abandon the form, even though they have lost the spirit. For a day will come when these embalmed seeds will be revived and men will read again in the ancient symbols the vital Truths that inspired them.

If it be thought that we are here entering upon a subject too deep or too exacting for the ordinary individual, it must be answered that nothing worth having is to be won without effort, and that if knowledge dropped from the skies into the laps of the indolent there would be nothing left to reward the efforts of the energetic. Mathematics, science, music, use complicated notations that are meaningless until diligent study has invested them with their significance; and there is no branch of learning or of industry that does not call for patient effort. In religion alone has the indolence of humans been appealed to, by the provision of a scheme of salvation requiring only the profession of belief in another's sacrifice. So long as people are willing to remain satisfied with this indolent form of religion they may leave all to Jesus; but if they "ask to see the distant scene," they must gird up their loins and put on their sandals. So, if we do not find that science and theology will fit comfortably together and save us all trouble, let us either give up the problem or make up our mind to solve it. If we take the latter course, let us expect effort and patience. Neither hasty conclusions nor petulance are at all admirable, much less helpful. There is such a thing as the Truth, and many have found it, but it is not for the faltering.

More virile conceptions of religion are much needed at the present day, especially when there is so much force on the other side. No religion is worth the name unless it demands sacrifice and effort, encourages free inquiry, and a bold attitude towards life. STUDENT

Real Results**

Photographing the Vital Fluid

SHADE of Reichenbach! In the *Technical World Magazine*, and reprinted in the *English Mechanic*, is an article called "Rays of Life," describing how one Major Darget has presented to the French Academy of Sciences the record of his experiments in photographing rays emanating from the human body. He first obtained impressions from the finger-tips held near plates in the developing-bath in a dark room; and later, inferring that the rays must be analogous to x-rays, obtained impressions from the forehead through a triple layer of red, white, and black paper. A printed paper placed over the negative was even reproduced on it by these rays from the forehead and through the opaque papers. This experiment was checked by exposing the plate, with its printed paper and triple covers, to sunlight and to shaded light, with no result in either case. Other experiments, recorded, show that all has been done under exacting test conditions; and the conclusion arrived at is that living bodies emit rays. We are promised a demonstration of the practical use of the discovery by physicians in diagnosis. The color effects on the plates vary, it is stated, with the individual and his states of mind and health. The experiments, adds the writer, seem likely to lead to a method of immediately observing the processes going on in other people's minds.

Reichenbach and some others were before their time. And what becomes of the theory that life-force is but a phrase summing up the activities of molar particles actuated by "attraction," "affinity," etc.? Here we have it represented as rays of the ultra-spectral kind. Is this not just what Reichenbach said, though he had no modern formulae to express himself by? And then the derided Dr. Richardson, with his "nervous ether," so approvingly quoted by H. P. Blavatsky in *The Secret Doctrine*. Will justice now be done him? In vain do we search the account of these experiments for his name, or that of H. P. Blavatsky, or of Reichenbach. If the author of the French Academy paper himself has been more just and has mentioned them, it is well; but no mention appears in the account quoted above. It is not the customary usage to make these amends; and the exceptions to this usage, of which there are some, shine by contrast.

How materialism shook its sides over Dr. Richardson's "nervous ether," and how it slighted that rashly generous man! Will it now put up a statue to him, or are his ashes not yet cold enough?

Of course we shall have a pound of speculation for every penn'orth of fact, and doubtless this new vital fluid will be invited to assume the throne vacated by the Almighty, and pose as immortal soul to man and as prime agent to the universe. In other quarters it will be provided with an atomic structure and its functions calculated out in terms of $\frac{1}{2}mv^2$. More important than ever is it that our Theosophical teachings as to the constitution of man and of Nature should be known. For, according to the septenary classification, we have:

1. Physical Body.
2. Vital Principle.
3. *Linga Sarira* ("astral" body)
4. Personal Mind (*kāma manas*)

and these four, of which science is just beginning to discover a fraction of numbers (1)

and (2), constitute only the lower quaternary, beyond which we have:

5. Higher Manas.
6. Buddhi.
7. Atmā.

constituting the Higher Triad.

The discovery of subtle forces in the lower nature of man can only lead to the certain danger of their abuse, if not by the discoverers, then by others less scrupulous. The *astral* is not the *spiritual*; the *psychic* is not the *noetic*; a spook is not an angel; nor is every occult influence a good influence. STUDENT

Theosophy versus Psychic Fads

PSYCHIC fads and cults of all kinds spring up, attract people's attention for a while, and then sink into oblivion as people fail to find in them what they were seeking.

Many people are attracted to spiritism; psychic research; Christian "science"; psychotherapy; modern astrology; grotesque teachings purveyed under the name of "theosophy"—etc., etc. They are impelled thither, by an inner craving which they do not understand but which impels them to seek satisfaction for it. Sometimes they are stranded in one of such cults, but more often they find out their mistake and turn away to seek their unknown object elsewhere.

The restless movements of this vast floating population evince the hunger that is everywhere felt nowadays for something more real and earnest than the ordinary resources of life can supply. The absorption of business, the ceaseless round of pleasures, and the routine of physical habits, cannot avail wholly to silence the call of the spirit within for something that can feed it. The despair of the world, as it turns from the churches to science, and from science to the psychic fads, only to find the same showy but unsubstantial wares spread out to mock its hunger, is a greater affliction than the lack of the "bread that feedeth the shadow."

Ill work have they done who have used the name of Theosophy to cover foolish teachings, thus preventing many from finding out the true light there is in Theosophy as it was originally taught by H. P. Blavatsky. But the day is drawing nearer when true Theosophy will become better known, and then its recognition by the people will prove that it has a genuine message for them. STUDENT

Choquequiran

AN explorer who has recently returned from a trip across South America is described as the first foreigner to reach Choquequiran, which, according to legend, no man had seen for 400 years. The name means "cradle of gold," and is said to be the place where the Incas hid their treasures when they fled from the Spaniards. To reach it required a week's hard travel from Cuzco on difficult mountain ways, descending a valley 6000 feet deep, crossing a river by a suspension bridge of four telegraph wires, wading through a jungle, and then climbing 6000 feet. Choquequiran is at an elevation of about 13,000 feet. The explorer believes the place to have been a fortification. The buildings are not made of the finely-wrought stone of the palaces in Cuzco, but of roughly-hewn stone cemented together, and the interiors are in some cases plastered. The old waterworks remain, and some reservoirs are in good condition. T.

Some Views on XXth Century Problems

Vicarious Drinking

IN a monthly contemporary, an alcohol victim, hoping, as he says, "to jolt the alcoholic liquor slave business," tells the story of his life. Relying on no rhetoric or word-painting, he merely lets facts speak for themselves. The article is naturally anonymous, but an editorial note tells us that

evidence gathered in a careful investigation of the career of the author of this article shows that he has been just what he says he has been.

As he goes quietly along he throws in the following:

In 1893 William Jaques, one of the friends of my minor drinking days, one of the twenty young men influenced by my drinking habits to join me in drinking, cut his throat at a saloon bar. . . . Immediately after Billy's death I was excessively annoyed by a persistent hallucination of Billy's presence with me when drinking at saloon bars. Once Billy appeared to have "jumped" my body and got a drink for himself. I was standing at a saloon bar talking with a friend, but conscious of Billy's presence. Suddenly the "I am I" part of me was several feet from my body, attached to it by a tenuous cord at the solar plexus. Then I was jerked back into my body, and my friend was asking me, "Don't you think so, Jack?" I replied, "I don't know." He insisted, "You do. Say, come out of that. There was an expression on your face just now, when you took your drink, like Billy's." I then noticed that I had drunk my liquor without knowing I had done so. Perhaps being in the same saloon where Billy had killed himself aided in this hallucination. It gradually faded away, and in a year entirely disappeared.

"Billy" had committed suicide from despair at his inability to free himself from the alcohol clutch.

Belief in obsession died during the Eighteenth and Nineteenth centuries. Not however because there was any evidence against it; not because it had ceased to be able to account for a great mass of phenomena otherwise inexplicable; but because of practical disbelief in anything surviving the body. Materialism of course has no doubts about that. Others than materialists believe in survival, but believe in it as it were on Sunday or so vaguely as not to be a working hypothesis capable of really accounting for any actual visible fact in life.

The man who commits suicide is not only acutely conscious up to the very moment of his death, but his consciousness is *upon* that moment. His strained attention bridges the gulf, and in the moment after *he is still the same man*. The subtler apparatus of physical life was not killed by his shot or his knife; nor was it exhausted by disease or age. It must live out its term and he within it. If some appetite, like that for drink, was strong during life, it will still be so, and he may try to gratify it vicariously. If he does, and succeeds, his severance from his own soul, the bearer of his immortality, is sure; for he has now no physiologically-set limits to indulgence. The only limit would be the failure of the supply of mediums. And there are thousands in our day who make a cult of mediumship!

But if he resists this temptation to wreck himself and risk the wreck of another, the time of normal reunion with his soul will come at last. His offense will be purged and he will

have the divine rest between lifetimes that comes to all. Such, at any rate, is the teaching of Theosophy.

The victims of death by sudden misadventure is in very different case. For though in him too life is not extinct and the soul not freed for its own natural place and rest, yet he is not held awake by that intense strain of aroused and perverted will which insures for the suicide his post-mortem insomnia. He is stunned by the shock, passes into vague dream, and so finally into the real spiritual rest.

If the Church had understood even such teaching as it still actually possesses, there would be no suicides today. STUDENT

"Civilization" Victims

"YES, your attack is very just," says, the average well-meaning individual when you point to him that civilization is poisoning itself or slaughtering its own children; "but what can I do about it?" And in most cases he really does not know what to do that would be in the least effective.

Dr. Earl Barnes, the alienist and psychologist, has been attacking the typewriter. For about two months the use of it is a good discipline in attention and concentration:

After that the work becomes almost automatic. It is all taken care of by a small part of the spinal cord. The higher centers of consciousness, being given nothing to do, are *likely* to go to sleep.

The operator, so far as working hours are concerned, is likely to become as completely an automaton as his or her machine; the sleep of "the higher centers of consciousness" may be permitted to become permanent, and the individual as a potentially contributing thinker is extinct.

We have no right to put human beings to work on the plea of productiveness if their mental life is destroyed by it. We are still our brothers' keepers, although we are trust magnates.

The typewriter is not the worst offender. Any machine, in use all day, and requiring the constant doing of one or a few small acts making little or no call upon intelligence, is open to the same charge. And yet our industrial system rests upon such machines. Perhaps a great majority of the things we use come to us after having done something to destroy the minds, or the higher workings of the minds, of those who make them. Civilization works, in fact—and more and more—at a loss. It pulls the average level of mentality lower and lower. The individual victim who will, can of course save himself by proper conduct of his spare hours and of his mind while at work. But how many know enough to do that, or appreciate that it ought to be done? How many know the path *through monotony* of mechanical work, know that it may even be turned to profit?

This procedure, or the civilization itself, must stop. That is the simple law of the matter, a consequence inherent in its cause. We are not only not moving forward to, but backward from, that ideal America of which we have dreamed—or did once dream. Perhaps the dream is gone in the chink of cash and the clatter of wheels. STUDENT

The Signs of the Turn

IT is not always a good sign that science is moving swiftly. That is one of the easiest of the lines of progress. The material is always immediately visible, the next step clearly marked. Creative or imaginative effort is least essential; indeed progress can be made without power of that sort at all, by simple industry unilluminated by any anticipatory insight whatever, any sense of perspective.

Nor is a profuse literature of criticism a very good sign. When the creative epoch is gone by, the next easiest thing to production is to write about what has been produced, the way it was set forth and the men who did it.

When even the critical epoch begins to wane we get the epoch of smartness and of personality. The smart men cannot achieve a new thought yet they must somehow make an impression. In religion, free-lance heterodoxy was once a method of achieving this. Now, so universal is the heterodoxy that one English writer has gotten a reputation for brilliancy by the mere assumption of a romping orthodoxy.

The general invirility has touched philosophy. Thought's quest for unity has been formally renounced by the most noted of American thinkers; for him the universe is henceforth a "many" whose uniting bond, if any, cannot be found. And all the problems of ultimates have ceased in pragmatism.

Everywhere the wave of creative power has receded as far as it can. But this is the sign of the turn. STUDENT

Jealous Gods

THE "spirits," it seems, following august precedent, are jealous gods. They love and court investigation. They are aflame with esoteric wisdom, and if they have never yet communicated any, is not this merely because the "conditions" have never yet been exactly correct? But they must not be trifled with. They must have undivided devotion.

Hence the perplexity of a noted Eastern professor. He has been trying to make everything comfortable for the communications of a deceased scientific friend and whilom co-Researcher. But he has divided his allegiance. In plain terms he proposes to marry. He has accordingly been warned from "the other side" that this will not do. It must be all or nothing.

What will he do? If he marry, may he not be giving the spirits a permanently valid excuse that the "conditions" are unfavorable? If he do not and the communications continue to be empty, trivial, and unilluminating, will he not have thrown away a bird in the hand for illusory birds in a phantom bush?

Marriage or no, we would suggest that the spirits be left out of account. They have had sixty years of opportunity. And in all that time they have given no single gleam of evidence that they are not on the same side of the veil as ourselves; whilst they have indirectly furnished plenty that they have far less faculty than we for raising it—indeed none at all, being but *minuses*. H. C.

Archaeology

Palaeontology

Ethnology

The Mané Rutual

THE capstone of this huge dolmen when intact was about 30 feet long by 16 broad, with an average thickness of about 3 feet. Unhappily it is now broken in two, and one end rests on the ground. This silent witness will doubtless remain indestructible in the future as it has through the long ages of the past, and continue to testify to the grandeur which man has attained to and lost, until the day dawn when he shall have regained it. STUDENT

Science and the Antiquity of Man

SCIENCE has certainly done good service in ousting the Mosaic chronology and the idea that there was a special Semitic origin of the world some few thousand years ago. Geology demands many millions, perhaps even hundreds of millions, of years for the fulfilment of its scheme. Astronomy has familiarized us with vast lapses of time. Biology requires, for its evolution theories, as much time as ever it can have.

But, so far as *human* history is concerned, science still lingers under the pall of theological superstition, though it may not like to be told so. It is singularly hesitating in its willingness to allow much antiquity to man, and often adapts facts to its preconceptions rather than let the preconceptions give way before the facts. But, curiously enough, the very prejudices of science militate against themselves and force it to allow a greater antiquity to man than it is willing to. The evolution hypothesis, for instance, requires immense time, because man has evolved so little (if at all) during the ages of which we have any record, that we have to put back his origin to an indefinite distance.

A writer in the *Hartford Weekly Times* describes the Mosaic account as "derived from Chaldaea as to its mechanism, from Egypt as to its theism and origin, and accepted by the Aryan from Semite oriental imagery without question."

It starts mankind in family relations, and with an immediate language; but the first men, being corrupt and unreasonable, were almost utterly wiped out a trifle later . . . simply to supply a Semitic origin for the human race after (it is alleged) a divine creation thereof had evidently failed of its purpose.

But the *Genesis* allegories might as easily be traced to many other sources; they are simply one particular rendering of a universal allegory, to be found among all peoples. The CENTURY PATH has several times quoted ancient American creation and flood stories, with Edens, serpents, arks, ravens, etc. To accept such allegories as a literal account of the creation of the world is ridiculous; but it is not less absurd to reject them altogether. What we need to do is to make a comprehensive study of ancient religious symbolism, so that we can fit such stories into their proper place

Lomaland Photo. and Engraving Dept.

THE MANÉ RUTUAL, LOCMARIAQUER, BRITTANY

in all this vast and comprehensive scheme.

The same writer says that back of the ancient Egyptian language, there was a decaying literary language at least a thousand years earlier, so that we cannot assign less than 10,000 years to the Semitic and many more thousands to the Egyptian language.

And the Aryan language, having passed the monosyllabic and agglutinative stages, is only known to us in the inflexional stage; which gives it an almost fabulous antiquity compared with the Semitic. So scientific theories of the evolution of language demand a great antiquity for man.

But what valid reason can there be, once we have thrown over theological superstition, for limiting the age of man? Is mere length of duration in itself an obstacle? No such obstacle is admitted in astronomy, geology, and zoology; then why in man's case—unless theological prejudice still rules? If there were an earth with vegetation and animals, why could not man have been there? The reply that we find no evidences of him would not be in point here; for the present question is, Why do scientific men try to minimize the importance of the evidences? If there is no evidence, there is no need to minimize it. And there is plenty of evidence; many of the remains found are much older than the dates assigned to them, and would have been admitted to be so, were it not for the prejudices, which are allowed to color the conclusions. Some of the most ancient races were the most cultured, and therefore must, on any theory, have had a long past behind them.

So science, though it has rescued us from much superstition, needs to be careful not to become dogmatic in its turn. STUDENT

Missing Pages of Classical History

OUR notions of the map of history, and of the position we occupy on it, have been derived too largely from the Graeco-Roman classics, which happen to have been preserved for us, to the exclusion of other important sources, such as those of ancient Hindûstân, China, or America.

Yet even this classical knowledge is incomplete and fragmentary.

The *Sitzungsberichte* of the Berlin Academy, speaking of a new text found on a leaf wound around a mummy, says that the style of the letters shows the date to be the second century B. C. In the text mention is made, in formal order, of legislators, painters, sculptors, architects, and mechanics. Although only the most prominent are enumerated, there are some new names. A certain Phoenician, Abdaraxos, produced the objects of mechanical art found in Alexandria, and one Dorion invented a war-engine called "the ender of war." New texts are also referred to; and this is only an extract from a larger work. Evidently our historical scrap-book contains many large and eloquent omissions, destined, if filled in, to change our ideas. T.

Chemistry 4600 Years Ago

A CHINESE delegate to the recent Chemistry Congress in London read an interesting paper on the chemical industry of China. Alchemy was known at least 2700 years before the present era, its principal object being the cure of disease. Metallurgical work and dyeing have been known from time immemorial; while the processes of making gunpowder, paper, glass, and porcelain all originated in that ancient land. STUDENT

✻ The Trend of Twentieth Century Science ✻

Rival Nebulae

PROFESSOR See is doing some service to astronomical science, perhaps better than he realizes, by his steady opposition to the current theory of the origin of the moon from the earth. No planet, he thinks, was ever detached from the sun, nor arose in a rotating Laplace-nebula of which the center became the sun. Nor was any moon ever detached from its planet. The rotation of the planets is too slow to correspond with the hypothetical original speed of the Laplace-nebula, and too slow to cause them to hurl away their moons. "It is sufficient, therefore, to say that the moon never had a terrestrial origin, and all this terrestrial speculation is without a foundation."

According to his theory two streams of cosmic matter meet "head on" or nearly so. As they graze shoulders they are drawn into rotation about each other. The center of the rotating spiral becomes the sun; planets, small and large, arise at knots in the spiral; the larger finally pull the smaller in their neighborhood into revolution around them instead of around the main center. Hence the moons. The theory has much in common with that of Professors Chamberlin and Moulton.

To the system thus formed, planets may subsequently be added as captured comets, and then re-captured and transformed into moons by existing planets. To which we may add that such a captured mass may be *vitalized* by the planet which captured it, the latter then "dying" and — in the case of our own home — becoming the moon of the mass which it first captured. In which sense the moon would be the mother of the earth.

The See-nebula therefore differs from the Laplace-nebula in respect of its origin, of its spirality, and of its lesser speed. STUDENT

Natural Chemistry

THE more that is known of the interplay of plant and soil, the more complex it appears. The soil is by no means a passive mass of matter, but an exceedingly active laboratory; nor is the root the mere open end of a suction apparatus. In it also, active chemical operations are going on, so arranged as to correspond with those of the soil.

In *Prometheus* Professor Witt reminds us of an old experiment upon which we have now some new light:

A vessel having an opening at the bottom is filled with loose soil and then sprinkled with a solution of niter, nitrate of potash. The stream which emerges from the opening at the bottom is pure water, the nitrate having been retained by the soil.

What became of it? How was it retained?

The experiment, whilst needing explanation, explains why a heavy rainfall does not wash all the soluble salts down out of reach of the plant roots.

The puzzle, it appears, is due to the presence of a variety of silicates known as zeolites. In addition to silica they contain alumina and another metallic base. Upon this other depends the service they render to the plants. It can be readily replaced by any other base, the one that the zeolite takes from any mixed

solution with which it is supplied being the one present in largest quantity. In that power lies the remarkable peculiarity of the zeolite.

The winter rains, weathering the soil, throw some of its salts into solution; the most soluble salts, those of potassium — most in request by plants — being dissolved in largest quantity. These are pre-eminently seized and fixed by the zeolites and prevented from being washed too deep. The roots of the plants growing in this soil come into contact with the grains of zeolite. Now roots are organs of excretion as well as of assimilation. They are accordingly able to exchange for the potassium of the zeolites, which they need, the salts of sodium, calcium, and magnesium, for which they have no further use or which they have previously taken up in excess of their needs.

We now understand the fact which has long been known, but hitherto has remained inexplicable, that plants at times take up metals for which they have little or no use in building up their substance.

They take them up for the purpose of making a subsequent exchange.

The zeolite is, however, not a necessity. Plants can of course take up what they want direct from solution; a power proved by their ability to grow in nutrient solution of the necessary salts without any soil at all. In the same way they can and do take nitrogen direct from the air — a phenomenon of recent demonstration — without the aid of soil bacterial and chemical processes.

One of the rôles of humus, it appears, is in line with that of the zeolites. It *chemically* absorbs the root excreta, rendering organized carbon compounds in exchange. STUDENT

The Sins of the Colon

THE disinfectant action of the intestinal juices appears to be exhausted by the time that the colon — the last five feet of the entire digestive tube — is reached. Here flourish those bacteria whose products Metchnikoff regards as the cause of senility and death; bacteria against which he preaches the crusade of sour milk.

There is even already a medical suggestion in favor of the removal of every new-born infant's colon! And there is much interested inquiry into the condition of those adults in whom the colon has been surgically removed for disease. A London surgeon has between thirty and forty such cases on his list, and examination has revealed that they are more or less free from the harmful bacteria — of course. But in none of them was the operation farther back than five years; and though they all appear to be in fair health, no judgment as to their chances of escaping senility and deferring death can yet be given.

A colleague of Metchnikoff's makes, however, a real contribution to the question. He has fed a certain bat on germ-free food from its birth, and its intestine is sterile; its health is also such as to make him think it will live much longer than its fellows.

We can hardly manage to live on germ-free food. But amidst all the dietetic experiments

there has been none, so far as we are aware, directed to determine upon what diet putrefactive bacteria are fewest. They sometimes disappear on an exclusively flesh diet, but the objections to this are so numerous as to put it out of court. For man it is as much a strictly medical prescription as a course of arsenic or strychnine, and the patient requires the same watching during its continuance.

Various diets might be tried; one with the exclusion of sugar; the exclusion of meat and flesh; the exclusion of all animal products; the exclusion of wheat, of leguminosae; and the restriction to fruit and nuts.

One of these might turn out to meet the requirement. Still too much must not be expected. Man commits other sins than those at the table, some of them perhaps of much greater importance in robbing him of his last quarter or half century of years. We want some easy way, involving a minimum of self-denial, wanting it so badly that a routine amputation of a part of the digestive apparatus does not seem an extreme or absurd procedure! The way is not so easy as that. STUDENT

Surface Gold

IT seems that electricity bids fair to make the extraction of gold from sand, and perhaps from sea-water, profitable. A communication to the *Scientific American* tells us that a full application of this method would give all the nations of the earth enough gold to last them a century without any mining. Gold-charged sands (from old seas) exist over great stretches of Southern California, Nevada, both Mexicos, and Arizona; to what depth they extend no one knows. The existing beaches "from the Isthmus to the Arctic" are also constituted by vast areas of such sand. "There are also immense ledges and even mountains of low-grade ore, very refractory, which cannot now be profitably mined." And lastly there are untold quantities of "tailings" from the placer mines, still containing a small percentage of gold.

Attempts to work all these sources have of course been made for years. But the gravity principle has been a failure owing to the fine division of the metal; and in working with amalgamating devices it is found that the particles are so often coated or oily that the mercury will not touch them.

But it has been found that if the mercury is nascent — that is, new-born as a pure metal from its combination as a salt — under the influence of an electric current, it is much more absorptive of the gold. And the gold particles are cleaned by the same current which deposits the mercury. The sluice box is bottomed with a sheet of copper; the gold-bearing water is flowed over it, a solution of bichloride of mercury being added. One pole for the current is in the water; the other is the copper bottom which soon becomes thickly coated with the amalgam of the mercury and gold.

There seems no reason why sea-water should not ultimately be treated in some such way. Gold can of course be gotten from it; but so far not in sufficient quantity to pay the expense of extraction. STUDENT

Studies

Saint-Malo

SAINT-MALO, at the mouth of the Rance, completely covers the old island of Saint-Aaron, which is now joined to the mainland by a broad causeway. Though crowded with visitors all the summer and in close proximity to the fashionable resorts of Paramé and Dinard-Saint-Enogat, it remains in general plan a truly medieval city. One may still make the circuit of its magnificent ramparts, in the thickness of which are broad stairways, dwelling-rooms, and shops, though steam trams run just outside them and telegraph wires cross over head. Most of the streets are narrow, steep, and roughly paved, with high wooden-fronted houses on either hand. One of the most interesting old houses is that of the famous corsair Duguay-Trouin, who at the age of nineteen is said to have captured two English frigates with their convoy of thirty merchant vessels, and brought all his prizes into Saint-Malo. He was born here in 1673. Other sea-rovers cradled in this "stronghold of corsairs" were Mahé de la Bourdonnais and Sarcouf. Jacques Cartier, discoverer and explorer of the St. Lawrence, was a native of Saint-Malo and is honored by a statue on the ramparts. On an islet just off-shore and reached by a causeway at low water is the tomb of Chateaubriand, marked by a rough-hewn granite cross. This brilliant writer but unhappy man was born at Saint-Malo in 1768 and lived there during childhood; and many of his admirers bring flowers to place upon his simple tomb. V.

Plant-cells and Animal-cells

THE difference between animals and plants has been defined to be that plants can live on chemical salts, such as ammonium carbonate or potassium phosphate, which they are enabled to use because they have chlorophyl; while animals cannot utilize salts as food, but must have proteids, fats, etc., that have already been manufactured by plants or by other animals. This distinction, however, does not provide for fungi and parasitic plants which have no chlorophyl. Nevertheless minute organisms can be divided into those which, like green plants, live on salts, and those which, like animals, live on ready-made proteids, etc.

But an important point about

Lomaland Photo. and Engraving Dept.

GENERAL VIEW OF SAINT-MALO, FRANCE

the unicellular animals is that they have a complete organization—mouth, pharynx, renal organ, locomotive organ, etc.,—similar in function and general shape to the corresponding complex organs in the multicellular animals. Thus we cannot compare the body of a higher animal with a house; for in that case, as a biologist has pointed out, we should have to suppose that each brick was provided with a door, a window, a chimney, etc. A house is built of bricks, but an animal is built of animals; and though it might be going too far to say that a mouse is built of mice, and a louse of lice, still the respective cells of these animals are different and distinctive; whereas the same bricks will build anything from a cathedral to a sewer.

So the properties of a complex organism do not depend on the arrangement of the cells,

complete animal with organs and senses.

In physics and chemistry the same principle obtains. It is of no use explaining the properties of matter by the static and dynamic functions of atoms, if these atoms are themselves matter. (A recent writer on crystals says that polymorphous transformation, formerly explained as a re-arrangement of the molecules, must be regarded as a change in the molecules themselves; molecules of a single kind can assume only a single arrangement. The state of aggregation of the molecules cannot affect the properties of matter as profoundly as is commonly supposed.) In both cases the essential properties seem to inhere in the units rather than in the arrangement of the units; and analysis by subdivision is not the right method to apply in searching for a causal explanation. The microscope does not carry us to the boundaries of the organized; it merely shows us fully formed organisms, differing in size, but in no essential property, from the larger ones. And, though we perform in imagination the analysis we cannot perform in actuality, and suppose atoms endowed with attraction and motion, we might just as well endow them with brains and legs, since it is surely more wonderful to be able to move and act without these organs than with. So this kind of analysis does not lead to any real simplification; for the truth is the units are not to be found in the sphere of materiality at all; *they do not pertain to our physical space-perceptions.*

How little there is that we can know through our physical senses and the conceptions we derive from them; and how essential it is for one who would know the causes of things to penetrate beyond the veil of materiality by mastering the attractions and illusions of the senses. STUDENT

Path

From the HYMN OF MAN

NOT men's but man's is the glory of godhead,
the kingdom of time,
The mountainous ages made hoary with snows for
the spirit to climb.
A God with the world inwound whose clay to his
footsole clings;
A manifold God fast-bound as with iron of adverse
things.
A soul that labours and lives, an emotion, a strenu-
ous breath,
From the flame that its own mouth gives reillumed,
and refreshed with death.
In the sea whereof centuries are waves the live God
plunges and swims;
His bed is in all men's graves, but the worm hath
not hold on his limbs.
Night puts not out his eyes, nor time sheds change
on his head;
With such fire as the stars of the skies are the roots
of his heart are fed.
Men are the thoughts passing through it, the veins
that fulfil it with blood,
With spirit of sense to renew it, as springs fulfilling
a flood.
Men are the heartbeats of Man, the plumes that
feather his wings,
Storm-worn, since being began, with the wind and
the thunder of things.

But they know not the spirit for master, they feel
not the force from above,
While man makes love to disaster, and woos deso-
lation with love.
Yes, himself too hath made himself chains, and
his own hands plucked out his eyes;
For his own soul only constrains him, his own
mouth only denies.

Swinburne

The Science of Life

THE maxim of the ancient sage that man
should know himself, is applicable to
that phase of existence in which each
man lives his daily life of conscious being—
his thoughts, feelings, and experiences. The
bodily mechanisms through which the least
important of these experiences reach the real
man inside, are of secondary consideration.
The main point is, that science of the inner
life which lies beyond the tangible surround-
ings, the life which is the all absorbing interest
of the moment, from hour to hour, and from
day to day.

A great many people are unaware that there
is a science which deals with this art of living.
They have not studied it in any way, and be-
yond a tacit acceptance of certain proverbial
maxims which have come down from ancient
times, they do not know of any such science,
still less do they try to form their lives upon
the laws which govern it.

Yet the proverbs which are traditional in
the folklore of all peoples, show plainly that
mankind has an intuitive knowledge of the

existence of this recondite lore of the ages.
How else can we account for such sayings
as these:

As you make your bed, so must you lie.
Evil be to him that evil thinks.
God helps those who help themselves.
No pains, no gains.

And so on. A little examination will easily
convince us that there is more real wisdom in
the proverbs of the nations, than in all the
creeds and dogmas of their historic churches.
And the reason is evident. It is because of
the instinctive inborn knowledge of the truth
which most people have, however much it may
be hidden.

In this crucial era of the world's history an
appeal is made to this instinctive knowledge
of what is true. The time is past when people
were ready to accept the mandate of any self-
constituted authority which proposed to do
their thinking and judging for them. A very
healthy distrust of churchianity has arisen. It
has become apparent that the church organiza-
tions have little or nothing to tell the restless
souls of the dawning age about where they can
find the truths for which they are thirsting.
And unless the churches can rise into a sub-
lime and *disinterested* search for truth, they
will continue to pass away. They are being
challenged to teach something which men need
in these days—the Science of Life. The
question is, can they do this? If not, what
then?

And yet, could these same churches recog-
nize the existence of this science of real hu-
man life, what a wealth of illustration they
could give from the teachings of the master
of that science whom they profess to follow!
The Sermon on the Mount is full of these
pearls of wisdom. Why are these not studied,
expounded, and elucidated that their noble and
eminently sane value may make itself evident
in the lives of those who profess to be follow-
ers of Jesus? The answer is that for eighteen
centuries the self-appointed exponents of
Christian teaching have, in the main, been far
more concerned with their own personal su-
premacy than with a sincere desire to instruct
the ignorant in the science of the real humani-
ties. And so, at last, the real simple truths
taught by the Galilean, the truths which every
one—from the child to the sage—can under-
stand, have been buried under a stupendous
mountain of selfish interests and dogmas which
holds the Christian world hypnotized, puzzled,
and distracted by its glittering monstrosity.

One or two instances of the real teachings
of Jesus must suffice. They are of course in
every instance identical with those of earlier
expounders of the Wisdom-Religion.

In the gospel of *Matthew*, v, 39, we have
the celebrated passage which reads in King
James' Bible "Resist not evil," but is now
translated "Resist not the evil man." A world
of misunderstanding has followed the dwelling
upon the literal acceptance of these words,
very few people seeking the real meaning
which underlies them; and in some cases, car-
ing less about it, than the endeavor to support
themselves in some argumentative position.

Now the fact is that the passage would be
much better translated "Resent not the evil
man." This puts quite a different complexion
upon the meaning of the text.

What bearing has this upon the science of
life? We find ourselves in a world which is

engaged in the throes of a great endeavor to
understand evil and good; in a struggle to
resist evil that good may prevail. This is the
cause of the existence of humanity today. It
is the reason why we live.

But each man who recognizes this can only
take his highest and truest part in the contest
impersonally. A very little thought will con-
vince us that he who allows a feeling of resent-
ment against an evil-doer to over-balance the
calm judgment of the experienced fighter for
truth, will run the risk of injury to his cause.
There is no such thing as holy wrath or divine
indignation; but there may be an uncompro-
mising will to fight for the truth at all costs.
A man who allows resentment to enter his con-
sciousness, may find before long that there is
little else present with him. He has lost his
true power and the inspiration which should
be his guide. A feeble illustration of this is
the well-known fact that in worldly affairs,
when a difference of opinion takes place be-
tween two men, the man who gets angry is
generally in the wrong.

Very few people have realized the enormous
power of that calm, clear-sighted determina-
tion to uphold truth. The man who maintains
this position refuses to allow himself to de-
scend to the level of the animal nature which
would conduct its disputes in the same way
as two roosters in a barnyard.

The saying of Gautama Buddha that hatred
must be overcome by love is part of the same
idea. It is the maintenance of an attitude
above the level of the lower material nature.
This attitude is an absolute solvent of hatred
and evil. There is another saying of Jesus:

Take no thought for the morrow, for the morrow
shall take thought for the things of itself. Sufficient
unto the day is the evil thereof.

This saying has suffered from all sorts of
extraordinary perversions, down to that of the
improvident man who, because of it, refused
to insure his life, so that when he died,
his children became a burden upon his aged
mother. But how different when we regard
this injunction as intended to counteract a
general distrust in the world in which we find
ourselves, the worrying phantom which op-
presses so many to their inmost soul. They
know no trust in any law or guiding agency
outside their limited material vision, and they
are harassed continually about what is going
to happen. If such as these could once know
that "not a sparrow falleth without the know-
ledge of the Father," they might then perhaps
find time to concentrate their attention upon
the duty of each moment as it passes. They
would surely find that "sufficient unto the day
is the evil thereof," and they would have a
superb trust in the morrow caring for the
things of itself. What a sublimity of philo-
sophy there is here, and how little understood.

STUDENT

BURDEN not the back of Aries, Leo or Taurus,
with thy faults, nor make Saturn, Mars or Venus,
guilty of thy Follies. Think not to fasten thy im-
perfections on the Stars, and so despairingly con-
ceive thy self under a fatality of being evil. Cal-
culate thyself within, seek not thyself in the Moon,
but in thine own Orb or Microcosmical Circumfer-
ence. . . . Whatever Influences, Impulsions or In-
clinations there be from the Lights above, it were a
piece of wisdom to make one of those Wise men who
overrule their Stars, and with their own Militia con-
tend with the Host of Heaven.—Sir Thomas Browne

From SIGURD THE VOLSUNG

FRESH shall thy memory be, and thine eyes like mine shall gaze
On the day unborn in the darkness, the last of all earthly days,
The last of the days of battle, when the host of the Gods is arrayed
And there is an end forever of all who were once afraid.
There as thou drawest thy sword, thou shalt think of the days that were
And the foul shall still seem foul, and the fair shall still seem fair;
But thy wit shall then be wakened, and thou shalt know indeed
Why the brave man's spear is broken, and his war-shield fails at need;
Why the loving is unbelovèd; why the just man falls from his state;
Why the liar gains in a day what the soothfast strives for late.

William Morris

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question What substitute can Theosophy offer for the fear of hell as a deterrent to the natural wickedness of man?

Answer In the name of heaven no substitute at all; it would sweep that whole wretched "deterrent" away, and not seek to cast out devils through Beelzebub the prince of the devils. There never was a man yet, who was the better for being a coward; and fear is among the deadly sins and perils of mankind. Nourish that within you, and you are always postponing your attainment of humanity. A good man is a dignified and brave man; he stands in fear of nothing, but fights the evil of the world for compassion's sake, and for the love and glory of fighting it, and because of the healthy human nature that is in him; and what the world is in need of most, is good men of this stamp. They cannot be brought up on fear.

There is a central sun within us, by whose light we can sit in judgment on all our customs and doctrines; as if we were children of a golden age, and called to pass sentence on the manners of a fallen and degraded people. Enthroned yourself there, and look down on suppositional men held from evil by "threats of hell and hopes of paradise"!

There is a great scorn in you for all unworthiness; you recognize meanness and pettiness of soul as the properties alone of some race of dwarfs, elemental and subhuman; to be human, as you judge, is to be at least humane and manly. Above all things you know that fear is a prime gateway into hell, a corroding disease destructive of manliness. King Volsung was told that he was certainly going to his death; well, it was a small and necessary thing to die; but no small thing, and no incident, to set the fashion of word-breaking; he would certainly go, though it were merely on a visit of courtesy, because his word had passed. That is the kind of thing you understand and have sympathy with; it is the spirit of the real man, who goes into no heroics over death or self-sacrifice, but does stand on guard lest through him evil should come into the world. Now, from this standpoint, what think you of the fear of hell as a "deterrent for your natural wickedness"? Man, it is an

affront to you to speak of it. The great and greatest deterrent to the lower nature is, that one should be possessed of a certain ancient and natural dignity, a certain confidence in the unassailable honor and soothfastness of the soul within him. That thing Theosophy aims at, and will restore at last to the world.

You will have no great good from humanity until it comes; and it is not far away nor impossible either, but innate in man; overlaid, not absent; not to be introduced, but merely uncovered. You see the tree and guess the root; you see the man, and may guess at the hidden god. True, the god is so far hidden, often, as to give some color and excuse for the argument that nothing but fear will serve for the demon that appears on the surface; let him fear then, in a manly way, that manly and just Law of Nature that assures the consequences to every act, and hedges man about, with equable penalties, from destruction.

The bad man, who has gone the courses in evil, does not fear hell, nor believe in it; he has long been there actually, and having grown accustomed to the realities of evil, is not to be frightened with scarecrows and imaginary terrors. When the first promptings of his lower nature came to him, he may have been restrained from action by the fears that had been instilled into him; but these fears did but work inwards like a creeping paralysis, murdering what natural strength and resistance there was in him; they did not silence the promptings to evil. When the step is taken, as it had to be, for fear had left him powerless to withstand it; then that same belief in hell began to act as a deterrent, sealing the way behind him: it is an extravagant, abandon and unwholesome idea; and extravagant, abandon and unwholesome were his reaction and revolt from the restriction of it. It induced a lawless, unbalanced atmosphere about his mental prospect, and he was likely to prefer hanging "for a sheep than for a lamb," as the saying is.

But the truth is that the bulk of us are not in wild revolt and turbulent wickedness, but mere comfortable, placid sluggards morally; we eat and drink, and never bestir ourselves, and are the encumbrance and sore trial of the world. That old belief has perhaps half numbed our eagerness and aptitude for actual evil; but it has also paralysed our potency for good; an insipid and uninteresting result, with the Laodicean angel for guardian and overshadower. Oh smug, unmanly doctrine; and men cumbered with oblivion that have accepted it!

We must reverse our conceptions, and polarize ourselves towards the right and noble, not, as now, towards the wrong and ignominious. The world stands in need of a brave and normal manhood that should grow muscular on the brave love of excellent thought and action; in very truth this is the norm and standard of manhood, and our own general glozing and perverted sensibilities are sub-normal. Poison has been instilled into our thought-world, and dwarfed us until we are pygmies instead of men. Our brains have gone to work to find cover and excuse for the evil that we have cherished; and we have brought all manner of traitors, "enlightened selfishness" and the "instinct of self-preservation" and their kin, into the council of our philosophies. We have forgotten the soul, and ourselves, and our

kingdom and our power and our inward spiritual glory; and fobbed up nightmares such as this fear of hell to keep ourselves from ever remembering them.

But Theosophy calls back the hero spirit into us, and reminds us of the divinity from which we have weakly fallen. It insists upon the souls within us, which are our very selves; its hope lies in awakening the feeling of soulhood. It does not tell you that you can change at once from what you have grown to be into a potent, infallible angel; but it would have you fix your high ideal and strive mightily towards it, with faith moving mountains of obstacle; for all faithful effort brings this knowledge and perfection nearer to humanity.

The world has no use for cowards who walk warily in fear of the lash, so that they may get as far as death uncompromised, with all heed and anxiety to end there. Never shall the high path we travel cease; never shall we find peace except in the teeth and natural confronting of danger. But there we shall verily find it; let us depolarize ourselves then, and seek our joy and glory in the manly place they inhabit. Man is here upon this earth to do and think great things, and to learn magnificent lessons; and his lower nature, and all temptations and difficulties, are the whetstones on which he shall make himself keen and bright, and new provinces to be conquered.

But fear shrivels one up within himself, and blights all the generous expansiveness of his true condition. A man is good for the world, or bad for it, according to one thing only; the character that is within him; how much he is *man*, or how much cur, or demon. His actions indicate this, but only indicate it; they are not to be thought of as the thing itself. It is the keynote of his being that counts; the way he rings and what he stands for. These things affect the condition of the world, without waiting to declare themselves in actions. They proclaim themselves, and heal or poison while he is asleep, or indifferently occupied in whatever way. To be in the midst of suspicious people will blight the best buds of our generosity; and the cynic hardly needs to speak, to make enthusiasm go limping and ashamed. These are but trifling instances, and well within our experience, of a very universal fact; half the world would be geniuses but for the stifling, abominable mental air that we breathe; the sensuality and what arises from it — cheap-mindedness, ignobility, cynicism and meanness.

Here then is Theosophy's substitute for the fear of hell — a rousing knowledge of the divinity of man, of the actual, contemptible sequences of wrong-doing; of the purpose of life and evolution; of the high glory, worthiness and fascination of our real mission in the world. M.

WELCOME the beggarliest truth, so it be one, in exchange for the royalest sham! Truth of any kind breeds new and better truth; thus hard granite rock will crumble down into soil, under the blessed skyey influences; and cover itself with verdure, with fruitage and umbrage. But as for falsehood, which, in like contrary manner, grows ever falser, what can it, or what should it do but debase, being ripe; decompose itself, gently or even violently, and return to the father of it, too probably in flames of fire?—*Carlyle*

THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS
REORGANIZED IN 1898 BY KATHERINE TINGLEY

Central Office Point Loma California

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

A Banquet for the Spook

THE *Dundee Advertiser* says that in County Wexford is a tomb sacred to the relics of a member of the "Resurrectionists." In it is a furnished chamber with a table and a few chairs. On the table may be found laid out a meal of fowl, ham, mutton, and drinkables; the departed provided by will that this collation should be provided once a fortnight; the viands, if in the meantime untouched, to be given to the poor.

So far the meal has been "untouched," and the remains accordingly have been given to the poor. But there are legends to the effect that the deceased has appeared in "spirit form" and enjoyed his meal, and also to the effect that those who partook of the viands have been disturbed in the night by rappings on their doors and windows, and even by a weird voice demanding a share in the food distributed.

The custom of placing food in the tomb is widely prevalent, as archaeologists know. It was done for the benefit of the "shell" of the departed. It was not supposed, of course, that the shell would eat the physical part of the food, but it was believed that the shell would nourish itself on the essence. If this be so, then one can scarcely wonder at the food disagreeing with the villagers!

But the idea of keeping the shell alive is a most pernicious one. The shell is simply a corpse — part of the disintegrating personality of the departed. His body sinks, and the doctor pronounces life extinct; but in reality death has only begun. Ere the process can be complete there are other vestures to be shed besides the physical body. The remainder of the dying is accomplished in *Kāma-Loka* and takes a longer or shorter time according to certain circumstances. The existence of strong passions prolongs the life of the shell. It may obsess the living, obtaining vitality in the *séance* room, or otherwise find means of keeping itself alive. In this case the man made special provision. The prolongation of the life of disembodied shells is injurious both to the person concerned and to society. It is to the interest of the Soul to have the vestiges of the terrestrial impurities die out, and not to be kept alive and increased by indulgence. It is to the interest of the living that the astral plane should not be tenanted by the soulless and frequently vicious shells of the dead.

MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

What with spiritists putting themselves into communication with these entities and mistaking them for the spirits of the departed; men of science and learning, as ignorant in this as they are learned in their own subjects, rashly experimenting; so-called teachers of psychism professing to hold communion with the shades of the deceased; and journalists who seem to think that all knowledge, of whatever kind, should be instantly made public — the danger to the sanity of the race is great.

An understanding of Theosophical teachings would show people the distinction between the higher and lower nature of man, the difference between the immortal Soul and the spook or shell, and many other things that they need to know if they wish to assume the right attitude towards these subjects. STUDENT

Beauty

MR. A. C. BENSON, in his *From a College Window*, has a chapter on "Beauty," a subject which has always formed a fruitful theme for contemplative writers. He writes charmingly on the sense of beauty, and its import; and though one cannot of course quote to any extent, one may select a short quotation as a sample and a starting point for comment:

What a strange power the perception of beauty is! It seems to ebb and flow like some secret tide, independent alike of health or disease, of joy or sorrow. There are times in our lives when we seem to go singing on our way, and when the beauty of the world sets itself like a quiet harmony to the song we uplift. Then again come seasons when all is well with us, when we are prosperous and contented, interested in life and all its concerns, when no perception of beauty comes near us; when we are tranquil and content, and take no heed of the delicate visions of the day; when music has no inner voice, and poetry seems a mere cheerful jingling of ordered phrases. Then again we have a time of gloom and dreariness; work has no briskness, pleasure no savor; we go about our business and our delight alike in a leaden mood of dulness; and yet again, when we are surrounded with care and trouble, perhaps in pain or weakness of body, there flashes into the darkened life an exquisite per-

ception of things beautiful and rare; the vision of a spring copse with all its tapestry of flowers, bright points of radiant color, fills us with a strange yearning, a delightful pain; in such a mood a few chords of music, the haunting melody of some familiar line of verse, the song of a bird at dawn, the light of sunset on lonely fields, thrill us with an inexpressible rapture. . . . I always feel that the instinct for beauty is perhaps the surest indication of some essence of immortality in the soul;

and indeed there are moments when it gives one the sense of pre-existence, the feeling that one has loved these fair things in a region that is further back even than the beginnings of consciousness. . . . I have felt in such moments as if I were on the verge of grasping some momentous secret, as if only the thinnest of veils hung between me and some knowledge that would set my whole life and being on a different plane.

And what if this sense of a richer, fuller being come, not from "God," but from our own Spirit? What if the blissful state of which we thus obtain fitful glimpses be the real and normal condition of our existence, and this ordinary life, which we have considered so real, be but a troubled dream? What if there have been races of men on this earth to whom that better life was their habitual life, while their successors have gradually degenerated into the present condition?

Old allegories tell us how man fell away from a state of light into a state of darkness by yielding to temptation and misusing his powers; and how he was clothed in "coats of skin" and driven forth from the "garden." But they also contain promises of man's redemption and return to the light, promises of which the Teachers have ever striven to remind fallen man.

We cannot hold on to these transitory glimpses of beatitude so long as our minds and hearts afford no fit abiding-place. The god must have his temple; and there must be no money-changers in it. Again and again does Truth come to teach us, and we fall to worshipping the hem of her robe or go into raptures over her beauty. Her lesson is that we should make our life beautiful, that we should make beauty a duty.

If we desire to have beauty as a constant companion, let us *live* it; let us make our acts beautiful. Let us not try to find it in our fancies but in our inmost being; there only can it abide. The rose of beauty blooms for him who amid the human heart-cries hears a clarion-call to kindly deeds and purer life — a potent inspiration to right action. STUDENT

The Irish Oireachtais

THE Irish have just been celebrating the thirteenth Oireachtais or Irish language festival. During the past sixteen years the progress of this movement, in spite of all kinds of open and hidden opposition in well-known quarters, has been remarkable, and the leaders of the Irish revival have much to be proud of. What seems a curious illustration of the misleading character of some statistics, occurs in the figures for the decade 1891-1901, which show the percentage of Irish-speaking stationary at 14½. In reality it was the superposition of two curves, one descending and the other ascending, and in 1891 the ascending curve had barely neutralized the other. Eight years have elapsed since then, and no doubt the figures for 1911 will prove remarkable.

There are elements in language revival which go deeper than we are apt to think;

What has been accomplished, therefore, is most encouraging, and can only lead onward to a still higher enthusiasm, when it begins to dawn on men, as it is dawning now, whither the re-awakening of the *genius* of a race will lead. For it is not only that the significance and world-relation of an illimitable past begin to unroll, but that the spirit underlying that past and its languages and legends will begin to be understood in a new way; when the mythological, the allegorical, and the historical will be regarded with a wider and juster sense of proportion.

Practical people, according to their lights, wonder what is the good of harking back to the past, or of trying to revive past atmospheres. Would it not be better to concentrate on the readjustment of railway rates, establish new industries, get back to the land, till, farm fruit, and so on? Both are necessary; but as regards the former, it will have to be-

probing into the happenings, not of a few short centuries ago, but of hundreds of thousands of years. Parallels with Greek and Chaldaean theogony, equally with Scandinavian, will emerge; and we shall be led to tracing the course of affairs back into times when the very ways of nature were far otherwise than now.

Meanwhile the Irish literature still awaits interpretation; and for that matter, a great deal of it still awaits translation; so that there is an enormous field of work yet to be coped with. It is estimated that in Dublin alone there are at least materials untranslated sufficient to fill 30,000 pages of printed matter. Much of this material is no doubt in middle Irish which is distinct from both old Irish, and the modern spoken tongue. The present movement, so far, has rightly confined itself to the preservation of the spoken language of our time. It is stated that more

(VIEW TAKEN FROM WITHIN THE GROUNDS)

elements which demand a rather wide outlook, and a perspective freed utterly from the ridiculous and dwarfed conceptions of time still prevalent in theological circles. Were it not for the broad outlook and wider knowledge revealed by Theosophy, the Celtic renaissance could hardly have other than a sentimental significance. But when we realize that *each* great sub-race is not only an organic element in our Fifth-Race evolution, but has its own peculiar soul-notes and correlations to contribute to the sum of human progress; when we realize that Celtic ideals and inspiration did in fact mold all that is best in European literature and art during the past thousand years and more, almost losing its identity in the process, we may discern a reason why in these times of rapid transitions, main sub-racial types should be impelled from within to regain the strong high notes of individuality, which the stress of events and medieval obscurantism threatened to efface.

come, and will become, something very different in character from that which has formed the *motif* of much current interpretation.

The intuition of the Celt turns to the past because he knows it has a message for him, and for the world. But he has not yet interpreted that message! On the contrary, there are but two main themes which occupy young Ireland in its studies of the past: heroes, whose sole *apparent* claim to greatness rests on the number of people they kill; and dreamers, whose claim to respect lies in their intercourse with the denizens of fairyland. Needless to say, neither the gore-stained hero, nor the dreamers of dreams full of shadowy tremulous beauty, are mutually consistent, or, after all, very inspiring.

But the keys! When we have learned how to apply them to these compressed picture-graphs, the fighting and the dreams take on other and wider meanings, full of the most startling interest; for we shall find ourselves

books in Irish are printed in Ireland annually now, than in English.

Altogether the progress made has been phenomenal, and as the brave editor of *The Irish Nation* declares,

it all simply means that a certain number of our people have discovered and put to unselfish purpose something of their deeper nature; and there is ever so much more riches to be drawn from the same store.

And it should not be forgotten that an important feature of the Gaelic renaissance has been the transcription and publication of much valuable folk-lore, which had never been written down. This has been done most faithfully, regardless of the extraordinary nature of some of the legends. It has been done in a reverent and scientific spirit, similar to that of the archaeologist who patiently copies hieroglyphs and ideographs, knowing that time, industry, and devotion to truth, will ultimately bring the keys of interpretation. IRISH STUDENT

Earthquakes not Casual

THE theory that cosmical events are due to "casual" forces is not only repugnant to reason but unsupported by fact. Earthquakes have been attributed to a shrinkage of the crust, or a slipping of the strata, or an explosion of heated chemicals—all of which come under the meaning of the word "casual" as here used. Against this explanation we may array first the feeling that the events of Nature cannot be ruled by chance and accident; second, the fact that earthquakes are accompanied by other phenomena having no bearing on the dislocation of rocks; and third, some physiographical facts which are mentioned below. The production of these last facts illustrates the manner in which actual scientific observation eventually confirms the very opinions which materialism opposed.

The facts alluded to afford additional evidence of the existence of a law of cycles in Nature, and also of the existence of definite connexions between certain distant parts of the earth. In both cases the tendency is to establish the principle of uniformity and method in place of fortuity and casuality.

Writing in the *Scientific American Supplement*, a government expert gives statistics of the earthquakes during the period 1900-1910, which has been one of great seismic activity, and shows that they reached their climax in 1907. Comparing the records of this decade with those of the two previous decades, he finds that the same periodic variation appears, the sixth and seventh years being most fruitful in seismic disturbances, while the second year comes next in point of numbers. In each decade the same periodic variations occur and they always correspond with the sunspot cycles.

Nothing in all the realms of nature is more perplexing than these variations, but the periodicity is incontestable; the grouping of these events into a certain period or fixed part of a period seems to prove that there are laws which govern the movements in the complex systems of the earth and of the sun, and that however discordant may be their action, the tone is eventually restored and they become once more parts of a harmonious whole.

The two great centers of active vulcanism are Mauna Loa in the Pacific and Vesuvius. Whenever a disturbance becomes pronounced on Loa or Kilauea it is followed shortly by an eruption or an earthquake at some point in the Pacific basin. In the Mediterranean the lines of weakness radiate from Vesuvius or Stromboli toward Sicily and Algiers, Cartagena and Barcelona, the Riviera, and Asia Minor; but there is a peculiarly intimate relation between Vesuvius and the Calabrian district, which is the more remarkable because there is no apparent connexion with Etna.

And so on with many details into which we cannot enter, but which show that particular earthquakes are not isolated phenomena. The Messina quake was only a more serious manifestation of the earth-waves which had been pulsating through the earth since the sunspot of last September. There was nothing to support the theory of a dislocation of strata, for the topography of the Straits has not been changed. Thus far the writer.

Evidently the earth is knit by something corresponding to the nervous system in man's body, which puts all the parts into sympathy, but some parts into special sympathy, with each other. And the impulse arises in this

nervous system, from whence it is transmitted to the solid crust, shaking it, whether it be loose or not. The existence of a material vehicle or substance, not composed of ordinary ponderable matter, has to be admitted in order to explain the transmission of etheric waves of light or electricity. So there should not be much difficulty in calling this medium into requisition to explain earthquakes. Altogether, taking one fact with another, we have plenty of ground for the theory that the earth has such an "astral body" and that there is connexion between it and the sun and moon. Earthquakes are primarily disturbances in this etheric body, the physical manifestations being merely secondary. Yet we can of course go back still further and inquire whence come the impulses that shake the etheric or astral body. And, remembering that the astral is the link between mind and body, we may get a glimpse of the connexion between events in the world of human thought and events in outer nature, and surmise that the belief which saw a connexion between the two was not a superstition after all.

In theories of seismic movement one seldom if ever finds any attention given to the following point. Materials which are perfectly solid and rigid on the small scale with which we are accustomed to deal in mechanics, can scarcely be so on the enormous scale of the earth's bulk; even the ice of a glacier flows like so much molasses. Can we think of the whole vast earth as a rigid body settling down and shaking together according to the dynamic laws that affect the movements of smaller masses? Would it not be more like a mass of soft wax, and is not the real marvel what holds it so still?

Ancient Tibetan Medical Science

(Translated from a Swedish Newspaper by Per Fernholm)

SIBERIAN Buddhists have petitioned the Russian government to establish amongst them schools in which the ancient Tibetan medical science shall be taught; and in consequence the Russian Academy of Physicians in St. Petersburg has made an investigation of this medical science.

As material for its study the Academy has used a Tibetan manual on medicine, which was known and in use in Tibet 1200 years ago and was even then considered very ancient and venerable knowledge. Much to their surprise they found in this book observations and cures which European medical science discovered many centuries after.

It is remarkable that the Tibetan physicians of so many centuries previous to our modern civilization knew so well the whole anatomy of the human body, how many bones there are, etc.; they even stated the principal nerves, giving 99 as the number of them, and estimated the pores of the skin as eleven millions.

"The heart is the king of all the organs and the support of life," it is further said in this ancient book.

Diseases generally come from the wickedness and ignorance of men, and above all from the incapacity of overcoming their passions, which disturb the healthy nourishment of the human organs. Every evil thought has a reaction on the heart and the liver.

To examine the condition of a sick person the Tibetan physicians of 1500 years ago used the same means as our modern physicians—

they observed the pulse, looked at his tongue, etc. Among remedies then recommended we find vegetarian diet, bath, compress, massage, and bleeding.

One of the most remarkable items is that physicians who did not clean their instruments thoroughly, met with severe punishment; in this point the ancient Tibetans were very modern indeed.

There are also prescriptions for healthy persons in this ancient work; they should "live an orderly, rational life, avoid debauchery and irregularities, and carefully attend to and purify both body and soul."

"The Seventh Degree"

AT last we have learned where "the infinite" lives and who takes care of it.

It lurks in certain caves at Simla, in India, and its keepers constitute "the college of occult science" there. We obtained these important secrets from a Boston newspaper, the paragraph being as follows:

August 6. —, theosophist and capitalist of —, recently divorced, will dispose of his earthly possessions and join the college of occult science at Simla, India. It will be a five years' course in the underground caves of the college, silent, alone and in the darkness. It will be five years of yearning after the infinite assisted by the concentration of adepts who are far advanced along the path leading to the unknowable.

"I shall leave in the fall after winding up my earthly affairs here," said —. "I have already been admitted to the seventh degree of the order through correspondence with the head of the college at Simla. Upon arriving at the college I shall go underground to the caves of silence, there to dwell upon the infinite and to grow by silent concentration into the spirit."

This would-be mystic's "earthly possessions," we learn consist of \$20,000, and from the heading—"Man gives up fortune for life in a cave"—we vaguely gather that "the infinite" will profit to the tune of that amount. The wife's grounds for seeking the divorce were stated to be "drunkenness and threatening to kill." The infinite does not seem to be very particular.

In an ancient manual of (real) Theosophical ethics, translated from the *Senzar* by H. P. Blavatsky, we read:

Believe thou not that sitting in dark forests, in proud seclusion and apart from men . . . believe thou not, O Devotee, that this will lead thee to the goal of final liberation.

The Theosophist takes up the burden of the world and carries all he can of it by contributing all the work he can. His progress to the seventh or the seventieth "degree" is according to the measure in which Wisdom and compassion deepen and illuminate his sense of duty.

H. C.

Ancient Standards of Measure

A RECENT writer draws attention to the system of measurement in ancient Babylonia. A cubic foot, 1728 cubic inches, of water weighed 64 "pounds," and contained 64 "pints." Thus a gallon contained 216 cubic inches. These relations had many advantages, such as their ready subdivision. A circle one foot in circumference has the primary forms marked by even inches, except the pentagon, which introduces decimal subdivision, leading to 360 degrees. Thus duodecimal and decimal systems supplemented one another.

Art Music Literature and the Drama

Prehistoric Art in Ireland—Part III

ENGLAND possesses no tumuli which can be compared with the wonderful specimens found in the ancient Royal Necropolis on the north bank of the river Boyne; but if we go farther afield into Italy or Greece we shall discover prehistoric structures whose resemblance to the tumuli of New Grange, Dowth, and Knowth, is so striking in certain main features as to place accidental coincidence out of the question. It becomes plain upon examining some of the so-called Etrurian and Pelasgic "tombs" that they were designed for more important services than merely to hold the corpse of some chieftain. The "Treasuries" of prehistoric Mykenae in Greece—a city whose story is lost in the remotest antiquity, but which was a great center of "Pelasgic" or Cyclopean culture—are well preserved and bear a close likeness to New Grange in Ireland.

The largest of these is called the Treasury of Atreus and a comparison of the first four figures on the left in the plate accompanying this article with those on the right will show how closely the Irish and the Greek tumuli resemble each other both in general plan and in ornamental detail. Observe the skill with which the prehistoric "Greek" artist has decorated the half-pillar with the three peculiar symbols so frequent in the Irish tumuli, i. e., the zig-zag, the lozenge, and the spiral. Similar pillar decoration is found at Persepolis in Persia, but is certainly of a much later date. A few years ago the side-chamber in the Treasury of Atreus was cleaned out and a large shallow basin was found resembling the so-called sarcophagi in New Grange.

The dolmens and stone circles and the ancient raths or fortresses, found in Ireland so numerous, need not detain us, for they show no specially decorative features; nor can we say much about the mysterious round towers which are almost peculiar to Ireland. These show few artistic features, not even enough to determine their age with certainty. A few show simple round arches and primitive moldings resembling the early Saxon in England; some of the towers may have been of comparatively recent erection, for it by no means follows that they are all of prehistoric antiquity. It is singular that no mention of them occurs in any Irish historical document. The presence of Christian churches near them is no proof that they were built by the monks; in fact their peculiar style of architecture

seems to imply that they had an entirely different origin, and that the churchmen merely founded their religious centers upon the spots which the Irish people believed to be holy ground. The complete history of these mysterious and picturesque round towers, when it is revealed, may give altogether unexpected light upon ancient spiritual knowledge.

Associated with the round towers we find many of the characteristic Irish crosses—large stone crosses with a circle surrounding the center. Most of them are richly carved, and in some cases the designs plainly represent scriptural subjects, rudely but effectively carved. The figures are generally out of proportion, and the "strap-work" and spiral decorations are the best-executed parts. The question arises: are these crosses purely Christian or of ancient origin? ANCIENT IRISH AND GRECIAN ANTIQUITIES

"MY COUNTRY, 'TIS OF THEE"

MY country, 'tis of thee,
Sweet land of liberty,
Of thee I sing;
Land where my fathers died,
Land of the pilgrim's pride,
From every mountain side,
Let freedom ring.

My native country, thee,
Land of the noble free,
Thy name I love,
I love thy rocks and rills,
Thy woods and templed hills,
My heart with rapture thrills,
Like that above.

Let music swell the breeze,
And ring from all the trees,
Sweet freedom's song;
Let mortal tongues awake,
Let all that breathe partake,
Let rocks their silence break—
The sound prolong.

Samuel Francis Smith

The National Hymn of America

THE American National hymn, *My Country 'Tis of Thee*, was written on February 2, 1832 and was first sung by school children in Boston on Fourth of July of the same year. The author, Dr. Samuel Francis Smith, was a young student at the time of writing it, and it was the result of his boyish interest in a German book of patriotic songs sent him by Dr. Lowell Mason, the musician, to be translated. He said to a friend:

While poring over this book I was very much impressed with a patriotic song contained therein, and while I was thinking of translating it I felt an impulse to write an American patriotic hymn. I reached my hand for a bit of waste paper, and, taking my quill pen, wrote the four verses in half an hour. I sent it, with some translations of the German songs, to Mr. Mason, and the next I knew of it I was told of its having been sung at the following Fourth of July celebration. The house where I was living at the time was on the Andover turnpike, a little north of the seminary building. I have been in the house since I left it in September 1832, but never went into my old room.

The author wrote, in all, nearly two hundred poems and songs but few have survived with any chance of immortality. He was a noted linguist, with an unusual knowledge of Latin at twelve years of age, and in later life reading and speaking fifteen languages. He took up the study of Russian when he was eighty-

six. A member of Harvard's famous "Class of '29," among his classmates were Oliver Wendell Holmes, William E. Channing, and James Freeman Clarke.

Similar hymns have been written, so similar that the composition of *America* has been claimed for Purcell by his admirers and also by the Scotch through a carol dating back to 1611. In 1790 a Danish patriot adapted native words to the music and later the Swedes did the same. The music even reached Iceland. STUDENT

New Irish Music Drama

EITHNE is the name of the new music drama produced at the Oireachtas in Dublin. She is a maiden from Tir na nOg—land of eternal youth—to be won by Cearg (Right). Students of realities beneath outer seemings may find much—theogonies and cosmogonies—to ponder in the simple little word Eithne. It means *the bird of sweet music*. They might discover a relation between the inhabitants of Earth, and Maddina Nag (the Irish-Chaldaean name for the planet Venus) hinted at in the legend. STUDENT

Can there be a greater joy than that of making all humanity feel the grandeur of that life of which we have glimpses?—Katherine Tingley

ENGLAND, Ireland, and Scotland generally represent themselves by the figures of

young and beautiful girls, as do most nations; we have Britannia, the Dark Rosaleen, La Belle France, and so forth; but in all Welsh cartoons it is an old woman you will find drawn for Mam Cymru, Dame, or rather, Mother Wales. Often enough these cartoons come from no friendly hands, and make her a broad, homely, and comic figure; but she is not so in reality; in the life there is no one more wise and queenly in her gentle, universal loving-kindness. Whoever you are, and however old, you must recognize in her a mother, or godmother, or nurse; she will give herself pains to pay you small attentions and speak you gentle and affectionate and comfortable words; and you will not see her at any time carry herself otherwise than with high, unconscious dignity.

She is to be found in a thousand clean, whitewashed cottages with roofs thatched or slated; walls speckless, that she herself white-washes over within and without I do not know how many times in the year, and floor that you must take a microscope to find dust on. She wears her skirt of strong flannel divided in front, and turned back on both sides—probably it came down to her from her mother, and her daughter will wear it when she is gone; her little straw hat with the brim turned down all round, and her snowy frilled cap underneath it. She sings Welsh songs over her work and her knitting; her eyes are big and deep and gentle and fearless; her soft Welsh words and her gentle broken English seem to have caresses running through the tones of them. If her cottage is on the village street, her heap of *cwlwm*, clay mixed with coal, will be at the side of it; if in some lane apart, it will be in the midst of a drowse and fragrance of bees and blooms. *Miss fach*, or *Syr bach*, she will call you; *dear little Miss*, or *dear little Sir*; and it will be hard for you to escape

THE WOMEN OF WALES

from her without drinking tea or milk, wherever the hands of the clock may be; or, if they are towards five in the afternoon, without eating her *bara planc* and *tisien*, bake-stone bread and cakes. In the vicinity of other meal times ham and eggs are what she considers you to be most in need of, and will press upon you. Then she will take you round her little garden, and gather her best blossoms for you: sweet-

lady once, who had lost her brother, and who was herself well over sixty. "Poor, dear Miss fach," was what she was saying, over and over again, very quietly; "Poor, dear Miss fach! Poor, dear young lady!"

Often enough she is *hysbys*, secretly wise, would she speak of it; and can see more deeply than the run of us into the mysteries of wings and hearts and blossoms, and hear deeper secrets in the humming of her bees and in the blackbird's song. But you will never get a word past her lips on such matters, or not without the utmost difficulty. There has been a long seepage of all natural beauty and wonderment into her soul; she is less troubled than an August afternoon, when a wisp of moon is in the pale blue above the woodlands; she is like the dusk of twilight in June, haunted round with a sense of unseen beneficence and spiritual being; as unconfined and impersonal as a night of stars, when the river is calling from the valley. Often death, of which she walks in no fear, is heralded for her with mysterious singing; often she hears such singing about the deathbeds of those she tends. Often too, she will evince a quiet knowledge of the needs and misfortunes of her loved ones far and near; especially when such knowledge will put it in her own power to aid or comfort them. I think she has carried down with her, unknown, secret treasures out of Druid days; and that the life-current circling the world will touch her one day, and reveal to her her mission and power for human upliftment; as the fire touches the coal, and releases the sun-force that has been buried in it for ages beneath the mountains.

Yet for all her gentleness, she is not of the weakly sentimental kind, and depend on it she has ruled her household in her day. The Welshman's house is not uncommonly the Welshwoman's castle; more so, I think, than in most lands; and it is quite likely that she was the business man of the two. But she

NOT THEY WHO SOAR

NOT they who soar, but they who plod
Their rugged way, unhelped, to God,
Are heroes; they who higher fare,
And, flying, fan the upper air,
Miss all the toil that hugs the sod.
'Tis they whose backs have felt the rod,
Whose feet have pressed the path unshod,
May smile upon defeated care,
Not they who soar!

High up there are no thorns to prod,
Nor boulders lurking 'neath the clod
To turn the keenness of the share,
For flight is ever free and rare;
But heroes they the soil who've trod.

Not they who soar!

Paul Laurence Dunbar (Selected)

williams, phloxes, roses, wallflowers, and sweet briar. And every bloom will come to you with a scent sweeter than nature gave it, and a lingering richness of magic haunting its petals, because of the wonderful, simple love you saw her put into the picking of it, and into the handing of it to you; as if you were a child with some child's sorrow on you, and she were giving you the flower to stay your tears. You will never grow so old that she will not take that revering and reverend attitude towards you. I heard her talking to a

ruled it with love rather than in the other way, and I have not known her children to turn from loving and revering her.

She went to London once, in those unimaginable days when she was young; and was filled with bewilderment at the tumult of life, and much more at the strange unfriendliness of the people. "'Deed, there's odd ways are on them, by there," she will tell you. "Nobody do give you a look nor a nod; nor nobody do tell *Good Morning* on you, nor *How are you* nor nothin'. They 'ont even stop the train for you when they do see you runnin' down the street. Frightened to death I was with them, whatever. No indeed, I will never go by there again; no, not I."

But she will. She will hear sometime that her old mistress up there among the Saxons is sick, or without a servant; or that someone is in trouble somehow; and then she will make a bundle of such belongings as may be necessary to her, and mount the train in fear and trembling—no question but that the guard will stop to pick her up, wherever he may find her waiting by the line; and arriving in London she will inquire her way in broken English from Paddington station, and reach her friends at last, heaven knows after how much suffering by the way. And then she will do the whole work of the house and nurse the sick ever so quietly and thoroughly and gently with her old, strong, tender hands.

Perhaps later on, someone will be deputed to take her out and show her "the sights of London"; but at this she will gently but firmly rebel. "Derr, I came to see *you*, not London, f'anwyld (my darling)," she answers; "you 'ont be sendin' me away from you now?"

She is treated as a guest, as an equal, of course; but not without infinite struggle against her scruples. You must almost force her to sit down in your presence; and I have seen her, when a youth dropped his handkerchief unawares, cover him with shame and love and admiration by darting across the room and picking it up for him, as if she were the most polished courtier, and he a great lady. The family she has once served, or merely lavished her kindness on without ties of domestic service, is the Royal Family for her forever afterwards; she would rather see the least of them, if only in the distance, than the king and queen and "all the king's horses and all the king's men."

It is said of Nisien in the *Mabinogi*, that he would bring peace and affection into a household when it was most filled with strife and bitterness and quarreling; and I have seen her do just that. She used to make periodical visits to a family that never sat down to a meal together without squabbling and undig-

nified recriminations—when she was not there. But as soon as Mam Cymru arrived, all that was put away; not consciously, not from any sense of shame; but simply because good will and friendliness came over the doorstep with her, and abided in the house as long as she did. And yet she was only an old family servant, with money enough saved, and leeks enough in her garden, to be independent in her old age; and a grand article of faith that no member of her "Royal Family" could by any chance do wrong. Nor they could, either do it or think it, when she was by.

Beth sy'n gwneyd y rhosyn gwiw
Ond gwlithyn bach yr boreu?
Beth sy'n cadw'r tlawd yn fyw?
Efe sy'n wybod oreu,

says Ceiriog; and we may loosely paraphrase it

her husband, the King ap Rhys, was away in Gwynedd; and was beheaded by them after her heroic defeat; to avenge which, the Teifi was reddened from Cardigan to the sea. And one might almost class Elizabeth of England with these; for she was Tudor, and *Welshwoman* is written all over her character.

Or the ladies of old romance and mythology, the "golden-chained daughters of the Island of the Mighty": Gwenllïan Deg, the majestic maiden; Myfanwy of the Mountains; Rhiannon the compassionate, whose three fairy birds you may hear singing, and listen to them a thousand years, and deem then that it was but one afternoon passed while you were listening. Or Creiddylad the daughter of Lludd Llaw Ereint (Shakespeare's Cordelia)—she was the most splendid maiden in the Three

Islands of the Mighty and the three islands near to them and in the Island of Ireland, and for her Gwythyr the son of Greidawl and Gwyn the King of Fairies fight on the Eve of May until the day of doom. Or green-veiled Ceridwen, whose cauldron was called Pair Dadeni, the Cauldron of Regeneration; if a dead man were put into it he would come to life; but he could never speak of the mysteries he had seen. Or Olwen ferch Yspaddaden Pencawr—"more yellow was her hair than the flower of the broom, and her skin was whiter than the foam of the wave, and more delicate were her hands and her fingers than the blossom of the wood-anemone amid the spray of the meadow fountain."

Or one might mention those three noble women of modern times, who did so much for Wales, so much for bringing the beautiful, strange, quiet poetry of her inner life

into the knowledge of English-speaking people: Lady Llanover, the Bee of Gwentland, Gwenynen Gwent by her Bardic name; that unfaltering combatant for all that is best in Welsh life against importations of vulgarity and the commonplace: Lady Charlotte Guest, who translated the *Mabinogion*; and the late well-loved Allen Raine, first and sweetest English-writing novelist of Wales and things Welsh. All these are representative, and awaken feelings of heroism, of poetic and mystic imagination, of gratitude and love; but it is to old Mam Cymru with her luminous eyes and her little round straw hat with the snowy frilled cap beneath it; with her bees and her flowers and her clean, clean cottage so constantly re-whitewashed; with her gentle melody of Welsh and her gentle, broken English, and her perpetual, overflowing kindness—it is to her that one turns at the last, as to the most representative figure among all the Women of Wales. I never saw her but I thought her a queen or goddess disguised, and expected her transfiguration. K. V. M.

THATCHED COTTAGE NEAR CLOVELLY, ENGLAND

thus, for you could not call it a translation:

What's it makes the rose so bright
But morning's dewdrop gleaming?
What fills the cottage full with light?
Her deeds of kindness teeming.

And he adds:

Efe wyr am hen wlad fy mam
A charedigrwydd Cymru,

it's all of it for the glory of the Motherland and the ancient warmheartedness of Wales.

There are many other types of Welshwomen of course; but I think that at the present time, this is Mam Cymru at her most characteristic; and you will find her, up and down the Principality, by the thousand. For the rest, one might mention the warrior queens of history: Buddug (you will pronounce that name so shamefully wrongly!) or Victoria, commonly known as Boadicea, who fought the Romans, and was slain by them, but not until she had fluttered their dovescots a little; Gwenllïan ferch Gruffydd ap Cynan, who led an army against the invading Normans when

Creeping snails have weakest force;
Fly thy fault lest thou repent thee;
Good is best when soonest wrought,
Lingering labors come to naught.

Hoist up sail while gale doth last:
Tide and wind wait no man's pleasure;
Seek not time when time is past:
Sober speed is wisdom's leisure;
After-wit is dearly bought:
Let thy fore-wit guide thy thought.

Robert Southwell (Selected)

Queen Philippa

FEW are the women during the Middle Ages whose names have come down through history. Only now and then, when the need has been great, they have stepped forth to take a more active part in the political life of the nations. One of these noble and strong women was Queen Philippa. She was the daughter of Henry IV of England, and the sister of Henry V, and in 1406 was married to King Eric of Pomerania who had succeeded Queen Margaret on the throne of the three united kingdoms, Sweden, Norway, and Denmark.

This was a most unfortunate time for Sweden. The king looked upon that country only as a dependency from which it was convenient to extort money for his constant wars. He seldom visited it and took no interest whatever in the welfare of the people. His Danish bailiffs obtained the money from the Swedes and with that he was contented. He soon became hated all over the country.

But Queen Philippa loved the Swedes. This strong, good, and brave woman could not bear to see such injustice and cruelty. She often visited Sweden and lived to better the conditions there. She assembled the leading men of the country for councils and introduced various reforms. For many years, while Eric was on a pilgrimage to Jerusalem, the government rested entirely in her hands and she showed herself a most able regent.

Philippa loved more than any other place the institution founded by the great Birgitta at Vadstena. There she used to stay when visiting Sweden, there she died in 1430, and there she is buried in the beautiful church. All her life she was a loving and most generous protector of the work at Vadstena.

Not only in Sweden but also in Denmark Queen Philippa's name is remembered with love and gratitude. Once, when during the absence of the king, Copenhagen was attacked by enemies, she heroically led the defense of that city. Wherever she was needed she was ready to go.

Queen Philippa deeply felt the needs of the times. She heard the call from her people and she came to their help. Her unselfish, loving work found response in their hearts and they loved their beautiful, heroic Queen. From the midst of the darkness of the fifteenth century she stands out as a beautiful example of true womanhood. BIRGIT

RESTING AT NOON. AN AUSTRALIAN COUNTRY SCENE IN N. S. WALES

Know Thyself

Pace through thy cell, old Socrates
Cheerily to and fro;
Trust to the impulse of thy soul,
And let the poison flow.

They may shatter to earth the lamp of clay
That holds a light divine,
But they cannot quench the fire of thought
By any such deadly wine.

HOW we should like to have been among the crowd that always surrounded Socrates the educator in the beautiful streets of Athens or in the Agora, listening to his teaching of the immortality of the soul.

Socrates was much loved by his pupils although he was ungainly and awkward, and unattractive to look at. He taught them to look for the hidden meaning behind the form, and thus they learned how to study their own natures and to know that the soul is the real man, and the body as the poet has expressed it, only "the lamp of clay that holds the light divine."

Socrates taught the purest system of morals and so he was persecuted as are all great teachers who preach against selfishness.

Condemned to die by drinking the poison hemlock, Socrates spent his last night in the midst of his pupils who had gathered in his cell to hear him discourse on the immortality of the soul. His brilliant pupil, Plato, made a record of this last conversation, in the *Phaedo*.

The poet has stated in this verse that the "light divine," the "fire of thought," the soul of Socrates would not perish as did his body. Because he helped people to understand their own natures, the immortal Socrates has lived through his teaching in the affections of the world of students ever since the great days of Greece. To think of his life and example is to think of his favorite maxim, "Know Thyself." Râja Yoga teaches that this knowledge comes from loving deeds performed with trust, will and constancy. E. W.

In New South Wales

MANY will remember H. P. Blavatsky's teaching that the continent of Australia is part of old Lemuria, most of which now lies beneath the Pacific, though Australia is usually looked upon as one of the newer colonies of the English-speaking people. Amongst this group of newer colonies New South Wales is the oldest and was until the federation in 1901 the one free-trade colony.

The harbor of Sidney is unrivaled as possessing safe havens for any amount of shipping, while the atmosphere of the capital itself is humid, a contrast to the usual dry heat of Australia generally. In the accompanying print we see one of the extensive sheep-ranches or runs, often the size of an average English county, with a population of just seven! When the yearly shearing of the sheep is finished, the wool is sent on wagons, each drawn by from eight to twenty span of oxen, to the nearest port or station. The caravan, as it would be called in the East, makes an attractive picture, as it travels patiently for days, or it may be weeks, across the plain or winds along the valleys of the Blue Mountains.

F. J. B.

-The Origin of an Old Saying

THE great Greek painter Apelles, always made it a rule when he had finished a painting to place it in full view of those who visited his studio, while he concealed himself and listened to the comments, so as to learn how to improve the work from the criticism it invoked. One day a shoemaker censured him for having painted one latchet too few on a pair of shoes. The next day the shoemaker again visited the studio and noticed that the mistake had been corrected. Then he began to criticise the rest of the portrait, but Apelles came forward and reminded him that a cobbler should not go beyond the shoes. This advice was the origin of "Let the cobbler stick to his last." J. H.

THE CHILDREN'S HOUR

THE FAIRY QUEEN

COME follow, follow me
You fairy elves that be,
Which circle on the green;
Come follow Mab, your queen.
Hand in hand let's dance around,
For this place is fairy ground.

Upon a mushroom's head
Our tablecloth we spread;
A grain of rye or wheat
Is manchet, which we eat;
Pearly drop of dew we drink,
In acorn cups fill'd to the brink.

The grasshopper, gnat and fly,
Serve for our minstrelsy;
Grace said, we dance awhile
And so the time beguile:
And if the moon doth hide her head
The glow-worm lights us home to bed.

On tops of dewy grass
So nimbly do we pass,
The young and tender stalk
Ne'er bends where we do walk;
Yet in the morning may be seen
Where we the night before have been.

An Old Song

The Lily Pond

"OH, Ben, look at the lilies!" exclaimed Betty. "Why do some grow so high and the others close down by the water?"

"There are two kinds," said Ben, "the lotus, and the water-lily. They belong to the same family, but the lotus is the genus *Nelumbium*, and the water-lily is the genus *Nymphaea*."

"Oh yes, I know," said Betty, "nymphs! How pretty they are, all white and gold."

"This is the lily the Greeks dedicated to the water-nymphs," said Ben, "and the tall rose-colored one is the sacred lotus of the ancient Egyptians. There is also the white lotus of the Nile, and the blue lotus."

"See what queer top-shaped cups on those, where the petals have fallen off," said Betty.

"Those are the seed boxes, and the seeds rattle in them as in a rattle-box," said Ben. "When the seeds are ripe we can see the big nuts set into the cavities like plums in a pudding. They are used as food in Asia, where the white lotus grows, and the tubers are also eaten as we eat potatoes, and some of the fibers of the leaf stalks are made into lamp wicks. I have heard that the discoverers who came to America found the same white lotus of Asia growing here, and they thought the aborigines must have imported it, as they considered it of such value."

"Well," said Betty, "I don't see why it could not have grown first in America if this is so old a land."

"Watch how the lotus leaf is unaffected by the water," said Ben, as he leaned over and splashed some upon it.

"How strange!" exclaimed Betty. "I never saw anything more interesting, Ben, than the way the water rolls off like tiny crystal

Lomaland Photo. and Engraving Dept.

A SHEPHERD'S COTTAGE

balls leaving the leaf the same as before; and the other lily leaves all get wet. How wonderful the lotus is! No matter how much water you put on, the leaf remains perfectly dry."

"It makes me think of that quotation from the *Gita*," said Ben. "How does it go?"—"Whoever in acting dedicates his actions to the Supreme Spirit, and puts aside all selfish interest in their result, is untouched by sin even as the leaf of the lotus is unaffected by the waters."

"Oh," exclaimed Betty, "how it seems to make you understand when you actually see it. Do you think, Ben, that something in our characters will grow so pure and self-reliant, that we can move out among people of all sorts and conditions and really remain untouched by sin as the leaf of the lotus is unaffected by the water?"

"I am sure that is what the quotation means," said Ben. E. W.

Cactus Forts

IN Southern California there still remain clumps of the old cactus or prickly pear hedges planted long years ago by the early settlers to protect their property from the Indians or any wild creatures which might damage their crops of vegetables.

The birds and the rabbits have found the old hedges a safe place for their nests and burrows, and many a cosy little home is placed there, where their enemies, the owls, coyotes, hawks, and hounds cannot get at them through the prickly spines of the cactus.

Indeed, the cactus, which is scattered all over the southwest, through California and Arizona, affords safe places for many kinds of animals and insects. Some cacti clumps are regular settlements for different kinds of creatures that can live together in harmony. Underground, below the cactus, live the rabbits and gophers, and next to the roots on top of the ground, the kangaroo rat, while

his neighbor, the wood-rat, builds his nest of sticks and straws in the branches, well guarded by the prickly plant.

High up in the smaller branches, the birds build their nests; mocking birds, finches, humming birds and others who know where to find a safe place for little homes; while spiders and lizards and many different kinds of bugs and beetles all find friendly shelter beneath the flat prickly leaves of the grim old cactus plant. E. P.

A Hero on the Field

HOW fine he looked when he was ready to start for the field of duty! What interest we had taken in him! each had vied with the other in helping to get him ready: one would arrange the sword in his belt; another fix the plumes in his helmet; while all were unanimous in their admiration of him.

And now, his duty done, he was coming back again. It was Father who fetched him, while we all ran to greet him as soon as they appeared.

He had served well: in storm and wind he was at his best; when less valiant soldiers would gladly have sought shelter he was ever at his post, with an aspect so formidable that the very sight of him caused the ever-lurking enemy to retire from the field.

What was his name? You never heard of him! I doubt whether any knowledge of him ever even reached the ears of those whom he had saved from being captured, through his vigilance day and night.

Like many another hero, in time of need he had appeared, fulfilled his mission, then vanished from the sight of men, to be heard of no more.

Now, just to satisfy your curiosity—our neighbors called him a scarecrow; but dressed up in Grandfather's old military suit, with rooster feathers in his helmet, and cudgel for sword, to the children he certainly looked a hero during his term of duty. A.

Increased Recognition of Ancient Knowledge

ATTENTION has recently been called to the fact that a well known man of science, Professor Soddy, has paid quite a tribute to antiquity in recognizing that it may have held secrets of nature as yet unknown to us. Instances of this new desire on the part of our men of learning to recognize the claims of the ancients are getting more and more frequent. The subject is in the air and they seem as if they could not keep away from it.

The distinguished Swedish physicist and chemist, Svante Arrhenius, is known as the author of books on the history of science, and his *The Life of the Universe* is reviewed in a number of the *Athenaeum*. So far as one can gather from the review, the author seems to have credited many of the ancients with a greater knowledge than modern scholars have usually been willing to concede to them, and to have recognized the value to modern science of a study of ancient science. But the reviewer, who, in spite of his friendly tone, does not disguise his consciousness of the

The Persistent Modern Bias

fact that the author is not on his own professional ground, seems gently to patronize him while holding a brief for the more customary and academic views as to ancient science and philosophy. This is reflected in the following remarks:

As to the Ionian philosophers . . . the author does but follow the younger physicists of this decade in attributing to them an almost supernatural foreknowledge of the current theories of evolution and of atoms. . . .

It is pleasant to turn from these excursions into an unfamiliar medium to those statements in which Dr. Arrhenius' independent judgment and long use of the analytical method stand him in good stead. Thus he tells us that the belief that water was the origin of all things sprang naturally enough from the observation of primitive agriculturists that the subsiding of the waters left behind it a deposit of fertile mud.

This does not strike one as a particularly sage remark, or one entitling its author to special credit for judgment and analytical talent. It surely cannot be intended to suggest that the ancient philosophers who assigned

Weighed in the Scales of our own Ignorance

water as the *prima materia* meant actual physical water. Yet, if this is not the implication, the remark becomes pointless. For, granted that the term "water" was the concrete symbol by which the philosophers chose to designate their conception of the primal substance, what is the point in telling us that they got the idea from an observation of physical water? Of course they did; where else could they have

gotten it? But, to be candid, one seems to discern behind these words the presence of a comfortably settled opinion that the ancient philosophers were more infantile and unsophisticated than ourselves, together with the notion that this statement of theirs about water in some way justifies that opinion of them.

But surely nothing can be clearer to a scholar who has made anything like a reasonable study of ancient philosophy than the fact that the philosophers were accustomed to designate their agents and principles by concrete symbols drawn from natural analogies, rather than by the abstract terms which modern philosophy uses. If this circumstance be considered as reason for depreciating them, one can only

say that the grounds are not obvious. Every philosophy must postulate a primal substance, an ultimate matter, and various hypostases. But while modern philosophy has often been content to accept such terms as "thought," "will," "consciousness," which are mere abstractions, ancient philosophy has preferred to designate the primary causes by names suggestive of the idea that they are actualities. When they called their *primum mobile* "water," they implied that it was an actual substance, a subtle element, *analogous* to water; but that they had in mind anything material in the physical sense, or indeed anything more gross and objective than what we mean when we say "consciousness," or the "universal mind," is an unwarrantable assumption. If this view be held as to their use of the term "water," the remark that they derived the idea from their experiences with alluvial mud becomes pointless.

In ancient science we find whole categories of such concrete symbols for primal elements: Fire, Air, Water, and Earth; serpents, trees, birds, and eggs; crosses, circles, and triangles; etc., etc. Will it be very pertinent or informing to remark that the ancients probably got these ideas from an observation of external nature? On the contrary, it will be a bald platitude — unless intended to convey, in some mysterious manner, the suggestion that the fact is derogatory to the ancients.

The same criticism applies to the use which the reviewer makes of the following quotation by citing it in the same connexion:

The simile of living nature, in which the organism springs from an apparently lifeless seed of an egg, has made the egg a common element in creation myths.

This merely proves that the ancients chose the very best possible symbol to denote their conception of the Mother-Nature, the great

genetrix; and recognized the seed and the egg as being its analogues in the natural world. We may, for reasons of our own, prefer to speak of an "Unknowable," or an "interstellar ether," or even a "God," but the symbol of a cosmic egg or seed is far more vivid, apt, and replete with meaning, than any of these words. Unless the ancients meant that the universe was hatched from an actual barnyard egg, their use of the word is in the highest degree creditable to them, and any derogation that may seem to be implied must surely be in our own minds.

The reviewer's attitude of a completer knowledge of ancient philosophy than that enjoyed by the author will scarcely stand, in view of a remark which he makes about the Babylonian division of the circle. He commends the author for saying that the Babylonians divided the circle into 360 parts on account of the 360-odd days in the year. This is surely a very bald remark; but it loses force when we consider the great number and variety of different modes of subdivision, scales of computation, and calendrical cycles used by the ancients. A study of ancient calendrical science, even if it be restricted to such materials as can be gleaned from encyclopaedias and easily accessible books on this subject, will show at once that the ancient world had a vast and complex system of computation, which most certainly did not rest entirely upon either arbitrary conventions or observations of obvious natural cycles. For, while the tropical and lunar years were natural, and such round numbers as 360 and 27 may have been conventional, we can hardly assign to either category such numbers as the 260 days of the Mexican year, the two-month year, the ten-month year, or all of the three different years used simultaneously in India at the time when Gautama Buddha lived, and still in use in some parts of the country, of 365-odd, 361-odd, and 360 days respectively. In short, the subject of ancient computation is very extensive and profound, and its understanding involves an acceptance of the idea that antiquity knew of certain astronomical and mathematical facts and principles of which moderns are ignorant. The reviewer does not seem to have given due weight to this.

To conclude: the day has gone by when we can rest comfortable in the belief that men of other ages and lands than our own were guileless and infantile, and all previous, pre-Christian, ages, mere introductions to the glorious epoch of Us. Our own rapidly changing notions are now passing from a phase of complacent sureness to a phase of uncertainty, and carrying us from the valley wherein our view was limited to our immediate neighborhood, to a ridge whence we can discern the vistas past. Science, having acted as guide to theology, is now about to perform a similar service for literary and historical scholarship; its discoveries in the realm of fact are vindicating ancient science, and it is evincing a disposition to examine the records for itself instead of taking its ideas at second hand.

H. T. EDGE, B. A., (*Cantab.*)

Elementals

A WRITER on the causes of accidents in street traffic considers the psychological side of the question, and points out that any defect in perception, judgment, or decision, may make the difference between life and death. Thus we can often readily trace the psychological cause of accidents; but suppose you are walking along the street and a coping-stone falls upon your head. What is the cause of the accident then? To assign it as "defective masonry" does not answer the real question; we want to know why the stone falls upon *your* particular head and on *that* particular day. The usual answer is that it is a fortuitous event, a chance, a casualty; and this answer suffices for most people. But more reflective minds perceive that this is no answer at all; it merely amounts to a restatement of the question. Accepting the question in its new form, then, we merely ask, "What is a casualty? What is chance? What do we mean by fortuitous?"

The fact is that this conventional answer indicates a gap in our knowledge. We simply do not know what are the causes which determine whether or not a brick shall fall upon our head. And life is made up of such events, whose cause we cannot discern, and which we call "casual." We gamble on these events, from the tossing of a coin to the turning of a roulette wheel. These events attend us through the day, determining the road we take, the people we meet, and a thousand other details. Yet, as they are all effects, they must have causes. Thus our whole life is largely composed of events whose cause we are unable to trace; and in such a condition of affairs it is not wise to boast overmuch.

But the corollary to this proposition is even more serious; for ignorance implies impotence. Since we are ignorant of the causes of most of the things that happen to us, it follows that we are at the mercy of those causes; we cannot control them, and they control us.

Corresponding to the effects whose causes we cannot trace are many causes whose effects we cannot trace. Perhaps some of these odd causes and odd effects would pair off. We cannot always trace the outcome of thoughts and emotions in the mind. They are forms of energy, and (under the law of conservation of energy) must produce effects. Sometimes they produce actions directly traceable to them; oftener they do not. What becomes of these lost thoughts and emotions—these energies and forces that pass out into the invisible space from every human organism?

Clearly there must be somewhere an aether teeming with vibrations imparted to it by the thoughts and emotions of minds; and it must be a potent agent in producing effects in the physical world. So very likely some of the so-called "casual" events are thus caused.

Can it be possible that our thoughts and emotions create elemental beings that remain attached to us and accompany their parent about, waiting for a chance to express in action the impress that their creator has stamped upon them? In the folly of our childhood we have called the ancients fools for believing in nature-spirits and daimones; but of late years it is the fashion to study the ideas of the ancients in the hope of finding something useful to the moderns. Were they

so wrong in believing in the existence of invisible beings, more or less endowed with mind, that are the agents of the happenings we call "casual"? Were they so wrong in believing that an evil passion could create an evil elemental, which would go forth, either to work ill upon the object of hate, or else return unsuccessful to wreak the anger upon the head of its creator?

Our science of today shows us that there are forms of light and forms of matter perfectly invisible to the normal eye. We are told that diseases are engendered and spread by "microbes," a conception which answers very accurately to the ancient idea of an embodied nature-sprite.

There is a whole world—nay, worlds—of beings, besides man and the beasts and the mechanical powers that we study. The elemental kingdoms are most potent agents in the affairs of life. Elementals cannot very well be defined in ordinary language, for our science has chosen to make an arbitrary distinction between "blind unintelligent" forces and intelligent beings; so that one would have to class the elementals as coming between the two—a sort of connecting link between the mechanical and the intelligent forces. An elemental is a sort of center of energy, a creature designed to perform one act, the act impressed upon it by its creator. It is easy to see that the presence of such things about a person would influence the events of his daily life; and in extreme cases cause the phenomena of the "Poltergeist."

But the classes of elementals are legion. The phenomena of physics and chemistry are in reality caused by such beings; some are related specially to the mineral kingdom, some to the vegetable, and so on. Those engendered by man's thoughts and feelings are more or less intelligent according to the amount of thought he puts into these creations; they may become veritable second selves. Thus can be explained all sorts of spiritistic and psychic phenomena such as learned persons are now investigating; and all sorts of Gods and Jesuses and ministering angels that inspire people; and on the other hand, "devils" and obsessing influences that prompt them to crime.

The attitude of superstition and the attitude of scepticism about these matters are equally foolish and harmful. What we have to do, sooner or later, is to arrive at a better understanding of these unstudied forces in nature, to the end that we may control them. The baneful effects of scepticism are that it leaves ignorant people to dabble in these matters to the danger of society, and to put themselves *en rapport* with the elemental world without any precautions, mistaking its mindless and dangerous denizens for beneficent powers, and thus courting insanity and moral breakdown.

Our jurisprudence, being based on a denial of the existence of such things, is powerless to deal with these cases, which nevertheless are fraught with extreme danger to humanity.

Hence the necessity for a sane science of life is apparent. And the one key to the practical mastery of the subject is *self-control*. Until a man can hold in check his own passions and propensities, he cannot deal with the elemental forces. Therefore Theosophy urges first the study and mastery of self, self-control, cleanliness of life. STUDENT

Some Views on XXth Century Problems

Thought-transference from Nature

HOW do we know that any other person is conscious? The recognized scientific answer is that we only *infer* consciousness from observing the same modes of action which in ourselves we *know* to be attended by consciousness. As Professor Clifford put it:

When I come to the conclusion that *you* are conscious, and that there are objects in your consciousness similar to those in mine, I am not inferring any actual or possible feelings of my own, but *your* feelings, which are not, and cannot by any possibility become, objects in my consciousness.

To this, Professor Pearson in his *Grammar of Science* objects

that were our physiological knowledge and surgical manipulation sufficiently complete, it is conceivable that it would be possible for me to be conscious of your feelings, to recognize your consciousness as a direct sense-impression; let us say, for example, by connecting the *cortex* of your brain with that of mine through a suitable commissure of nerve-substance.

Farther on, for this "commissure of nerve-substance" he substitutes "a suitable physical link." He goes on:

Indeed, there are some who think that without this hypothetical nerve-connexion the processes popularly termed "anticipating another person's wishes," "reading his thoughts," etc., have in them elements of a sense-impression of other-consciousness, and are not entirely indirect inferences from practical experience.

The link need not be physical, unless you count the ether—better called in this function the astral light—physical. If science postulates various ethers to account for various sets of physical phenomena, may not Theosophy do the same—perhaps calling them planes of *one* Ether—for correspondence with the many planes of consciousness?

If then there is any sort of medium through which we are already in some relation with each others' consciousness, may not the same have always justified the mystics in their assertion that all nature is conscious and intelligent? They have not been able to put into brain-made words and common thought-forms what they got from nature; but that they have gotten something we have no right to doubt. The testimony is unbroken and unhesitating.

STUDENT

Mutilating the Mind

A MEDICAL contemporary proposes that a careful investigation, according to modern methods, should be made of the condition of the hypnotized, beginning with those in whom the state has been induced with great frequency. A method suggested is that in which the investigator pronounces words to the subject, the latter replying as quickly as he can with others cognate in sound or meaning, the time-interval being measured. In one very extreme case recently reported in a popular monthly, the unhappy victim had been so often thrown into the hypnotic state that the sudden sharp pronunciation of a word, so far from provoking a reply, acted like a flash of light or even the gleam from a basin

of water, throwing her into semi-consciousness and sometimes catalepsy.

If say a hundred hypnotisms will do this, what will three or four do?

When this mode of investigation is applied to the study of alcohol, it is found that a single dose lengthens the time-interval of response, notwithstanding that the subject thinks his faculties brightened; and also that this lengthening lasts for two or three or more days after. The results of similar investigation of the hypnotized or even the "Emanuelized" might be very similar.

The parallel between hypnotism and narcotization by chloroform is close. In the latter case the body cells are thrown below the level of sensation, out of touch with it, so that they may be (legitimately) damaged by the surgeon. In the former case the mind is thrown below the level of the judging self; but *here* the "surgeon" knows neither anatomy nor physiology, and whilst he thinks himself to be removing one disease, will almost certainly be implanting several others.

How would it be to establish a sanatorium for the treatment of these people, for the restoration of their self-consciousness to its normal state? One will certainly be needed if the medical profession—to say nothing of the clerical—is allowed a free hand. It might also prove useful for those who have self-hypnotically compelled their minds to believe that there is no disease and no pain and that living sentient matter has no life and no consciousness. Mind is for the cognition and consideration of what is, and when healthy it will render very efficient aid to the soul. But when, in the course of its natural work, it is required suddenly to veto its own legitimate conclusions; when it receives a blow in the face whichever way it looks—it necessarily falls into a hypnotic or half-paralysed condition. It is like a child who is beaten for lying and for telling the truth, for running after its mother and for staying behind, for playing and for moping.

STUDENT

The Slaves of Life

"AN intensely strong character; he is under the influence of morphine all the time": does that sound like a reasonable remark; should we not say on the contrary that he was an utterly weak character, enslaved by a desire? Nor would the character seem to us any stronger if we were assured that no one could prevent this man getting his drug, that by absolute "strength of will" he compelled them to get it for him.

We should point out that some time this man would want to get free from his habit and that then his utter weakness would stand revealed.

It is only when the "strong personality" shall come to separate himself from his desires that he will find out whether he is really strong.

All of us see that such desires as obviously lead to death, for example the morphine-crave, are not the man himself; others, such as ambition, hate, the money-crave, we have not yet learned to separate in the same way.

Nature has arranged that the law of the sur-

vival of the fittest shall prevail among desires, one only at last surviving not only because it can never meet with direct obstacle, but because it gives life to him who serves it. When a man gives up all the desires to *have* and comes in to himself in freedom, he finds himself in one supreme moment to be the radiant youth he was at the dawn of the world, eagerly desirous to spread into all dark places the light that is in him. *That* desire is his very being, himself. The others have seized him by the heart later. It is awake in some, the musician, the artist, the thinker, sometimes the empire-builder; but even here so overlaid, so darkened and weakened with the desire to have, to get, as to function with only a thousandth of its full splendor of power. We are slaves by a myriad chains; those in whom the pull of the chains stops for a second sometimes, are the world's creators. But all of us are also that on some line, potentially. The cultured desire to give, to contribute, to raise, in fact compassion, recognized as self, is the key to self and freedom. Then nature herself will charge herself with the task of furnishing us with what we need. We can leave all that to her.

STUDENT

What Was It?

ONCE upon a time a great company of persons drew near to . . . , and the nearer they drew the more uplifted they felt and the more gracious and wise and loving they became.

But what was it they drew near to?

We do not know; we can only report what they told.

One said: Behold that most glorious mountain glowing gold in the sunrise!

It is not a mountain, said another; there is nothing to be seen at all. But infinitely sweet sounds are floating out upon the air. I hear harmonies like nothing that ever was on earth, melodies that thrill my very soul.

It is neither said a third. That is a place of perfume, the scent of the lily, the lotus, myrrh, the rose, jasmine, and balm.

O blind! said another; a *man* stands there, one of most noble countenance. As I look upon him my heart is warmed and softened and my mind filled with unutterable thought.

I also feel that said another; but no *man* do I see. Yet there is some Presence beyond anything human. It is as if my own innermost *self* were there beckoning me to come.

To me, said the last, it is absolute beauty, neither of form nor sound nor scent nor thought, but all at once and more. It is my self, as *you* have said—turning to the last speaker. But as I come closer in my feeling and try to fathom that mystery, by flashes I lose myself and see that it is also all of you, my comrades, and much more beside. Surely it is no individual person at all.

Then they agreed that they would give it no name, would hold it sacred, not letting mind make dogmas concerning that which was so evidently beyond its comprehension. But as they went away they felt that trust, and compassion for all that lives, and love of each other, had been born within them.

RUINS OF THE THEATER OF DIONYSOS, ATHENS

The Theater of Dionysos

THIS ancient theater, excavated in 1862, reveals even in its ruins a grandeur which can yet be but a faint indication of its original magnificence. Carved out of the hillside, its ample sweep must have sufficed to seat 30,000 spectators. The scene was one of great natural beauty, commanding a view of Mount Hymettus, the blue waters of the Aegean, and the islands of Salamis and Aegina, while the golden sunlight of that genial clime bathed the whole. In the front semicircle of the auditorium are seen the marble thrones carved with the names of the officers of state who occupied them. Opposite are the orchestra, the proscenium, and the stage, with its elaborate construction and its front adorned with fine reliefs on marble slabs.

The traditions in which we have been brought up have taught us to view antiquity with a disdain that reflects little credit on modern discernment. Ecclesiasticism has blotted out records and substituted its own bigoted version of history. The Darwinian theory has been applied to everything, and all things modern represented as the crowning point of a progressive development from rude ignorance. And the drama has not escaped; it has also been evolved, so we are told, from its pristine crudeness among the poor foolish ancients to its grandeur among the illustrious moderns.

Yet it may rest our weighted brow to throw modern sagacity to the winds for a while and contemplate the scene of ancient drama. It may please us to indulge in a wild and wicked dream and to try to imagine that scene peopled with an audience worthy of so rich a setting, and inspired by a drama whose grandeur should accord with the grandeur of the site. We can scarcely imagine a modern audi-

ence there, with its multifarious habiliments and retinue of bottles, orange-peel, and paper bags; nor can we seem to see a modern problem play, farce, or comic opera in progress on the stage. So let us give rein to our fancy and imagine that the ancient drama was such as to render this magnificent site the only appropriate setting; that the ancient audience had a dignity and endurance so far superior to ours as to be adequate to the occasion. Let us make believe that the modern critics have erred and see only the mote in their own eyes; that they are incompetent to understand the ancient dramas or to picture to themselves the ancient theater and its audience. Yet if a comparison of modern with ancient theaters is to serve as a criterion for a comparison between ancient and modern dramas, our imagination may well fall short of conceiving what the ancient drama must have been.

The drama has not been evolved from the traveling show, any more than high organisms or races have evolved from their own degenerate offshoots. Our modern drama is but a survival of what the drama once was. The beginning of the drama was as a sacred function in the ancient Mysteries. The rites of Masonry may help us to an understanding of this meaning. In the Schools of the Mysteries, teachings too lofty for verbal instruction were imparted by representations. As verbal language is the proper form by which we transmit the ideas in which we deal today, so the dramatic form is the means by which ideas that go beyond words have to be conveyed. The public drama may be regarded as an extension or modification of the esoteric drama, whereby the public were admitted to a participation in as much of the sacred knowledge as it was appropriate for them to know. It is

on record that one of the Greek dramatists barely escaped punishment for revealing too much.

As we proceed historically in the direction of modern times we find the drama becoming less sacred and more popular, until by stages it degenerated into a picture of actual worldly life, intended for amusement. In modern times we have had this amusement-drama; we have had the opera, into which the idea of art has entered, though the inspiration has not been high. Wagner strove to raise it higher; but he had to borrow from ancient sources—from our "barbaric" ancestors of Northern Europe. And lately we have had the problem play—a feeling towards reintroducing the didactic function of the drama. But it has usually taken the form of an exhibition of sores and has ended in an interrogation point.

In vain do we look for a drama that shall *inspire*—that shall send the audience away from their seats to *be* and to *do*, to *dare* and to *achieve*. We need feelings and convictions. A war scare comes on, and a man writes a drama on national defense; this is a real drama, within narrow limits. So we may have anti-slavery dramas, anti-alcohol dramas. But the inspiration is shallow. The old moralities and miracle plays dramatized religion, but we cannot dramatize modern religion. We cannot dramatize evolution, we cannot dramatize pragmatism. To teach we must have something to teach and somebody to teach it; our dramatists lack the one, and our actors the other. To depict life as it should and might be, we must know what it should and might be. Knowledge, conviction, enthusiasm, the old joy of life must come back again. But what has become of our Soul-life? Truth, Light, Liberation for discouraged humanity. H. T. E.

✻ The Trend of Twentieth Century Science ✻

Theosophy in Science

THE bacterium appears to be in somewhat the same case as was the atom ten years ago—awaiting resolution into still smaller components. The first step, so far as theory is concerned, was taken comparatively recently by Professor Butler Burke. His view is perhaps the nearest to the Theosophical that has yet been developed by scientific speculation. The primeval monads, according to him, are *alive*, life itself. Their first aggregation—into atoms or electrons or something smaller yet—would be as it were disciplinary, the restriction of their primeval chaotic freedom. They are but learning their first lesson, or taking their first step in the one great cosmic lesson, the art of living together as the essential for the enrichment of their life. This lesson is being learned in their vivid doings amongst each other behind the relatively external quiet of the atom. Then comes another step, or come other steps, perhaps not yet known by science. Finally appears the cell, say a bacterium.

But when we examine a cell we find parts within it. For example the nucleus contains a number of little units, the chromatin granules, each to some extent a life to itself with separate power of movement and nutrition. These in their turn do not look quite homogeneous, as if they contained still smaller units. Indeed these smaller ones *are* postulated on theoretical grounds to explain the phenomena of heredity.

The cell stage once attained, larger and complex cells arise, these also having to learn the great lesson of integration into a compound individual, the lesson of living together as the condition of the evolution of their individual life and consciousness into higher and richer states.

We use the word life, therefore, in more than one sense. Sometimes we use it to denote the essential being of the ultimate units. Sometimes we mean the force gradually compounding them into higher forms. But this force is itself a spiritual individual which the compounding enables to incarnate and live and gain experience, to pass from unmanifestation into manifestation. The aggregation of the cells of the human body enables a human soul to dwell therein—to its own profit and that of the cells amid which it dwells. What we call death is the temporary withdrawal of this force or incarnate entity, and the resolution of the units that were drawn together for its body, backwards into separateness; though this resolution perhaps now never passes back so far as the primeval stage.

If we take a long enough view a conception of evolution emerges. There are perpetual integrations of groups; a little chapter of life history is lived out; then follows disintegration. But the disintegration is ever less and less complete. Perhaps at one time in the world's history, when all was very elementary, it was common for atoms to integrate from the primeval units, live a little while, and then disintegrate. Now the life of the atom is very long, its dissipation perhaps never complete, and dissipations much more than counterbalanced by integrations. Now the atoms readily integrate into compounds, very stable, some of

them. Cells are now at the stage where the atoms once were; they are readily formed and as readily disintegrate to the molecular units that compose them. Farther on they may become as stable as are now chemical compounds and atoms. Lastly *their* integration may begin to take on permanency.

In the light of Reincarnation all this might be worked out for humanity. Through the ages there are continual groupings and regroupings of men until the whole shall compose one body and the sense of unity be the dominant of human consciousness. Universal Brotherhood is already formulated as *the* principle of life, and Theosophy is the anatomy and physiology of the principle.

The pressure towards this brotherhood is also worth considering, and what may incarnate in humanity as a whole when brotherhood is perfected. STUDENT

The Age of Life

DR. SCHMIDT of Jena, a well-known geologist, offers the following estimate for the duration of the five evolutionary periods, reckoning the whole as one hundred millions of years:

(1) Archeozoic or Primordial period	52 millions
(2) Palaeozoic or Primary	34
(3) Mesozoic or Secondary	11
(4) Cenozoic or Tertiary	3
(5) Anthropozoic or Quaternary, 100,000 years, or one tenth of a million years.	

He admits, however, that the one hundred millions may quite possibly be two hundred. Suppose, with Theosophy, we make them a little more than *three* and multiply accordingly, adhering to his figures. The five periods will then be:

(1)	156 millions
(2)	102
(3)	33
(4)	9
(5) 300,000, or three tenths of one million years.	

More closely the Theosophical figures are:

(1)	170 millions
(2)	103
(3)	37
(4)	7
(5)	1½

But according to Theosophy a human civilization of a sort reached its climax during the *third* of the five periods; another, the Atlantean, during the fourth; whilst during the same fourth our own Aryan began. Prototypal humanity, the sketch work as it were, existed even during the second of the five. But the sketches were possibly not choate enough to leave any fossils. STUDENT

The Metals in Medicine

A WELL-KNOWN U. S. naval surgeon has created much interest in medical circles by his report of twelve cases of tubercle treated by a special use of mercury. Of the twelve, six have been cured, two markedly improved, two are improving in somewhat less degree, and two have failed. The failure in both the last seems to have been due to accidental contraction of typhoid.

Several of our medical journals have of late been discussing the decreasing faith in, and knowledge and use of, drugs, vegetable and

mineral. Serums and "expectancy" seem to be the ultimate goal, the expectancy being of the results of ordinary hygienic measures.

But there are signs in the other direction. A French scientific journal asks why medical knowledge of the therapeutics of the metals is so imperfect:

Are not these potent agents at least as well worth new and close study as the animal extracts? We call copper, zinc, lead, and others, "astringents" and think that we have said about all that is worth saying. Have we said anything? Is mercury exhausted when we have called it an alterative?

We would suggest that one great step in practice will have been taken when the relations of certain plants to metals has been determined; that is, when it has been experimentally ascertained what plants are willing to take up which of these unusual metals. It might perhaps then be found that in the passage through plant life the metals had had their action as it were softened, brought into better relation with our physiology, raised to higher medicinal terms. M. D.

An Averted Fate

PROFESSOR LOWELL'S gloomy anticipations of the coming waterlessness of our planet do not seem to be exciting much apprehension among the geologists and his fellow astronomers. In fact some have detected subtle indications of a vicious circle in his argument. Thus: Mars is well on in the drying-up process. As our planet is very like Mars, the same drying up awaits us. Since we are going to dry up, that is evidently the fate that has befallen Mars.

But he does point to great rainless desert areas of the earth which once were fertile and well watered, regarding their fate as prophetic of that of the rest.

Professor Cleveland Abbe however disputes the inference. We have not historic (in the geologic sense) facts enough to draw conclusions. The cycles of change may be too great for the possibility of study. Oceans and continents change places. Continents may have a regular program as wholes or in their parts, passing through periods of watered fertility to aridity previous to submergence.

Nor do the great watersheds of for instance desert Africa afford any proof that the rainfall was once more than it is now.

Statistics are too recent (say a century old at most) to prove anything. And, says Professor Cleveland Abbe,

Neither meteorology, nor geology, nor any other branch of earth-observation gives clear, unimpeachable evidence of the progressive drying up of our globe as a whole. The fact that great glaciers once covered regions now free from them merely shows that in those regions there was once a different relation from that which now exists between rainfall, snowfall, evaporation, and run-off, so that snow accumulated then more than now. At the present time there is more rain and less snow or possibly more snow and more melting, so that the snow cannot accumulate. The ratio of the snowfall in the cold half of the year to the rainfall in the warm half must in general be large, if snow is to accumulate as in the glacial epochs of previous geological ages. Glacial phenomena tell us nothing whatever as to the absolute quantity of rain or snow. C.

SUNLIGHT AND SHADE, POINT LOMA, CALIFORNIA

Improving the Breed of Animals

IT is found by dog-lovers that the unpleasant habits which many people believe to be natural and inevitable in this animal can easily be eradicated by a little firmness intelligently applied. And the lesson to be learned from this is that it does not do to fetter ourselves with fixed theories. The limitations which we assign to Nature are to a great extent those which we have ourselves imposed by our minds; but when we cease to regard her as a bigoted tyrant, we find her responsive to our efforts. If we find that a certain class of animal has certain habits, we need not accept those habits as ineradicable and normal until we have tried whether we can change them. If we find that we can, then we may with some reason regard the new habits as natural and normal. For there may be no valid reason why man himself should not set a few fashions for Nature to follow, seeing that he is endowed with some very influential prerogatives. The so-called laws of Nature are impresses which have been stamped upon Nature at some time or another and by somebody; perhaps she will be found as ready to take a new impress when some reasonable being takes it upon himself to impart it, instead of waiting for some God,

theologic or scientific, to do the work for him.

Whether with animals or children, we owe a duty towards those whom we may regard as lower in the scale than ourselves; and if we neglect this duty we confute our own supposition that we are superior to them. To accept conditions as permanent and inevitable, simply because they obtain and have obtained for a long time, is to chain ourselves to a dogma and to relinquish our prerogatives as molders of Nature.

What are the domestic animals, anyhow? If they are not types specially created by God for the use of mankind, nor products of spontaneous evolution, it may be that they were formed from wild animals by some more intelligent and active race of men in the far past; together with the many orchard trees and garden flowers. Later and less influential races of men seem to have accepted these products as immutable types, but perhaps we might begin to see now what we can do towards improving the domestic stock still further. But though individual efforts may be successful, we cannot expect to do much on the large scale until the standard of humanity has been improved; for domestic animals are the servile copyists and devoted scapegoats of many human vices.

E.

Magnesia as Fertilizer

MAGNESIA has lately been used as a soil fertilizer. It is found in plants in considerable quantity, forming 13 per cent of the ash of wheat and 8 per cent of the ash of oats. It has been applied to the soil in the form of *kainit* (Stassfurt potash salt), which contains magnesium sulphate and potassium chloride. The yield of sugar beets was increased by 4500 pounds per acre and the percentage of sugar was not diminished; with grains the increase was from one-seventh to one-fifth the total crop. With barley the effect was to reduce the proportion of nitrogenous constituents. The potato crop was increased and rendered immune to the attacks of mildew; and the yield of hay from natural meadow land was increased from 3000 to 4150 pounds per acre.

T.

The Rats' Diet Bill

THE Department of Agriculture reports that rats destroy annually \$100,000,000 worth of American grain. One rat eats 60 cents' worth a year, and of oatmeal it will consume \$1.80 worth. Rat-proof construction, especially concrete foundations, is urged; also some rational methods of disposing of garbage and storing food.

Students'

Path

From SIGURD THE VOLSUNG

BE wise, and cherish thine hope in the freshness of the days,
And scatter its seed from thine hand in the field of the people's praise;
The fair shall it fall in the furrow, and some the earth shall speed,
And the sons of men shall marvel at the blossom of the deed:
But some the earth shall speed not; nay rather, the wind of heaven
Shall waft it away from thy longing—and a gift to the Gods hast thou given,
And a tree for the roof and the wall in the house of the hope that shall be,
Though it seemeth our very sorrow, and the grief of thee and me.

When thou hearest the fool rejoicing, and he saith,
'It is over and past,
And the wrong was better than right, and hate turns into love at the last,
And we strove for nothing at all, and the Gods are fallen asleep;
For so good is the world a growing that the evil good shall reap.'
Then loosen thy sword in the scabbard and settle the helm on thine head,
For men betrayed are mighty, and great are the wrongfully dead.
Wilt thou do the deed and repent it? thou hadst better never been born:
Wilt thou do the deed and exalt it? then thy fame shall be outworn:
Thou shalt do the deed and abide it, and sit on thy throne on high,
And look on today and tomorrow as those that never die.

William Morris

Light and Duty

KATHERINE TINGLEY says "If we would walk in the light we must make duty one of our highest ideals. There must be heroic determination in our hearts for a continuity of right action." As we go on studying Theosophy and trying to live by the guidance of its great truths we find a deeper significance in the sayings of our Elder Brothers and Teachers. If we would walk in the light we must have ideals and duty must be one of our highest. Duty is so often taken for something unpleasant, in fact the very word duty, from long-standing wrong-thinking has become a bugbear to many. Instead of that, our duty is what comes to us every day to be done, be it our work or our play; our pleasures, taken in due season, are a duty as well as our labor.

Is it not therefore really in the manner in which every action is carried out that duty lies? And do we not find that the most irksome of duties becomes at any rate interesting, if not a pleasure, when we begin to take a right view of life? Theosophy being a true

thing and a real guide, points out duty in every department of life; from our waking in the morning to our going to rest at night, every moment has a duty of its own. This fact makes plain the mistake it is to interfere with the duties of anyone else; for while we are doing that, we must be neglecting our own.

Clearly we see that duty must be performed as a high ideal, and moreover there must be a heroic determination in our hearts for a continuity of right action. The word heroic shows that it is not quite easy, although it may be moderately so, to perform our whole duty now and then, perhaps a whole day now and then; but when it comes to a continuity of right action, there is a great fight to be maintained to overcome the personality and to control the lower nature which always has some excuse to try to evade right action, when personal rights, so-called, are involved.

If there is heroic determination in the heart to do right, help comes from the light in which we fain would walk, and true wisdom is established in the mind. This true wisdom is spoken of by Krishna as "the light of all lights, and is declared to be beyond all darkness; it is wisdom itself, the object of wisdom, and that which is to be obtained by wisdom; in the hearts of all it ever presideth." And when a man has attained to self-control and continuity of right action, or in other words, true spiritual wisdom, he is able to help others. That is the true object of one who strives to walk in the light, that he may be as "a light to those who sit in darkness and in the fear of the shadow of death," that he may "see the truth, and the truth shall make him free."

This wisdom comes from the Higher Self and is the essential divinity of Man and is the basis of Râja Yoga, "Kingly Union," which is the perfect balancing of all the faculties, physical, mental, moral, and spiritual. Katherine Tingley says "This is attainable." E. H.

Devotion

IN the association of words and ideas the word Devotion seems always to mean the performance of a Religious duty—the giving of the best within us to the Highest, the Supreme. A noble example of this we have in the lives of all great World Teachers, whose lives were spent in service to mankind. In our time we have had H. P. Blavatsky, who in no way spared herself; who felt no sacrifice too great in order to bring to the Western world the message of Theosophy. William Q. Judge, who alone preserved it pure and handed it on to Katherine Tingley, whose life and work now speak for themselves.

Devotion is always the giving of something, time, attention, or affection, in a whole-hearted manner, the voluntary gift of a pure heart that seeks nought but the opportunity for service. Doing and giving are strong factors in life, and the desire to love is greater than the desire to be loved. The former is an attribute of Divinity, the latter belongs to the personal self and brings with it some very uncomfortable companions, jealousy, envy, and so on.

Divine love is compassion for all that lives and though ingratitude may be hurled upon the giver, still lives on and works on. Nor dare we pity those who even die at the hands of those they serve; could we but know their heart we would most likely envy them. Bereft indeed of joy are they who never yet have

learned the light of love in the truest sense.

The heart must spend itself on something. The monk in ecstasy kneeling before his wooden crucifix, and the prodigal son in a far country are each alike spending their substance for selfish ends, and finding no satisfaction, no blessedness like he who in true Devotion self-forgetting, makes of each duty a free-will offering to the Gods. Nothing short of the very best will do to keep the fire of true Devotion burning on the altar of the heart.

Through bitter experience and pain we learn that the way of peace is through service to others. "Inasmuch as ye have done it unto the least of these my brethren ye have done it unto me." The home of the soul is where we work in harmony with Law. We need great courage to keep on and not be daunted; courage when the battle is raging and we have to fight for Truth. Courage also in those trying times when "their strength is to sit still." To do our duty calmly and quietly in the midst of uncertainty. And here Theosophy aids us with its practical teachings of how to deal with the problems of life, with the every day difficulties that confront us, telling us we are Divine, and showing us how we can help to bring about the golden time of Universal Brotherhood.

STUDENT

'On the Spree'

IN an English contemporary devoted to literature there recently appeared an article entitled "On the Spree," as referring to a historical hero of 100 or more years ago, giving some account of that hero's "descent into the gutter." The sting of the article lay in its tail, which tapered off with the suggestion: "Let us be just and leave cant, and grudge not [this man] his little spree."

The impression conveyed to the reader is that if you do heroic deeds you are entitled by way of compensation to descend into the gutter and wallow in the mud from time to time.

Surely the reward for being great lies in the fact that you are great, and there can be no greater punishment for the higher nature which impels to noble action than to see the personality over which it presides, sink into the mire of sensual indulgence.

The average man is flattered by the ordinary appeal to his good natured tolerance for the foibles of the great, and later on he may be led to demand for himself the toleration he concedes to the hero off duty. Does he not work hard and make sacrifices for his family? Surely he too is entitled to an occasional plunge into the puddle.

But natural law is suspended neither for great nor small, and "He that soweth to the flesh shall of the flesh reap corruption," applies as much to brave admirals as to the average man who runs counter to the moral code. To denounce vice is not cant, and to "grudge our hero his little spree" is simply to light a beacon for the warning of a brother whose bark is visibly drifting on the rocks.

STUDENT

ALTRUISM is an integral part of self-development. . . . Theosophy teaches self-abnegation, but does not teach rash and useless self-sacrifice, nor does it justify fanaticism. —H. P. Blavatsky

THEOSOPHICAL FORUM

Conducted by J. H. Russell

Question Does Theosophy teach the value and necessity of prayer; and if not, what substitute does it offer?

Answer Prayer, we are told is the greatest consolation in life; and it is inferred that this is a grand argument in its favor. But the purpose of things is, not that we should be consoled, but that we should grow; and we ought to measure all tenets with this virile concept for our unit. Consolation, and doctors' stuff are both very well in their way, but not for our daily pabulum; an umbrella is excellent in a storm, but we cannot live under it always; we must have milk for babes, but the diet of strong meat will be forced on us some day. And sure, if one needs it, the universe is deep and full enough of consolatory things, patent and remarkable before our eyes; we need never be at pains to find them, nor accept them at more than a fair price.

Another thing is, that there is more than one to be consoled in each of us, and their ideas are different. It does not console you when you have lost your kingdom, to be offered a great pension and palace in the city of your conquerors, even when the land you lost was a meager and barren one and you ruled it with infinite exertion and unease. No consolation to *you*, the patriot and warrior; but to *you*, the voluptuary, it is consolation enough, for you could never fill the throne of your fathers. We are all of us soul and personality, and have two claimants on our regard, one of whom we must necessarily offend. "Ye cannot serve God and Mammon."

Theosophy sets this aim before us, showing it to be inevitable finally—that we should stamp out and overmaster the sense of separate selfhood. The worship of self clings so nearly to us, that we are apt to arrange our religion on the lines of a commercial treaty; we will accept the advantageous, and believe what coddles and nourishes ourselves. Now as to what will do the first, we are keenly enough aware of it; it is a mere toning down of the rigor of actualities, a finding of easy methods, back stairways, royal roads, scapegoats, etc. But of true nourishment we are not good judges; because to know that, one must be at the pains of taking the standpoint of the soul.

Evolution means always the widening and widening of consciousness. It is not enough that we remain where we are; *learn*, says the Law; *go forward*; that alone shall be counted to us for righteousness. To be human fully, would be to embody fully the human principle, having the animal nature in complete subjection; and the human principle is something more than mere brain. For this latter can live at peace with the animal within us; as the Prodigal Son could maintain himself after a fashion in the far country, and fatten for a time on the husks that the swine did eat. But he must remember the Father's house at last, or woe betide him. Brain is only an envoy or halfway house between the animal and the soul.

What then is the soul? All that we can sense of divineness; the thing that moves us to noble action and oblivion of self. We must attain to and embody it; we must be the div-

inest thing that it is in us to be; something far diviner and more glorious than we are. To play the part of a man means nothing less than to do this, living majestically as a soul, and pushing forward the growth of the world. Universal, not confined; birth and death are not the horizons of the soul, nor are our own trumpery affairs its interests. Its outlook is to the starting-point and to the goal of human life; it is ambitious for humanity, and desires for the whole world.

Judge prayer then, from this eminence, and you will come to understanding the right and the wrong of it. We are struggling in the bonds of selfhood, and have no advance but to shake them off; little by little, or in greater degrees, we must drive our consciousness away from our own concern and welfare, and into universality; thinking as for humanity, and not for ourselves. Every word that cometh from his mouth affecteth a man, and every desire that passeth through his mind; he is molded by them into new and new forms of character. You are today what yesterday you were, with the result of all your deeds and words and thoughts of yesterday added; and if prayer is at all earnest, and concentration employed in it, must it not leave a notable and particular mark? But of what kind? A scar, a pinching and cribrum of the limbs—or a cubit added to the stature?

Did it emphasize self in any way; did you desire your own upliftment and salvation? Then you have clogged your wings with a heavy and mortal unction; you may go the sleeker, and have more surface gloss; passion may trouble you the less, but where is the soul of you? Even farther away; even stiller has its voice grown.

We may put aside altogether the prayer that is mere material petition; for we live in a splendid, law-governed universe, whose purpose will not change for us, whine we never so loudly and long. That which is our own pursues us everlastingly, and will come home at the last, and heaven and earth cannot prevent it. Consider the position of a man who pours himself out in prayer for some desired thing. The seeds of all power and godhead are slumbering in him; each of us has, somewhere within, that magician's wand and sprig of omnipotence, the will. In his concentration and intense thought he may get such hold on this, as that it shall bring him actually the thing desired. But if self were his motive, he has only stretched the fabric of the universe the more violently from its place, and must expect the pain of the rebound. He has by that much tightened the strangle-hold of self upon himself. Nature will work with infinite pains to release him, and the pains will be his, not Nature's.

To whom or what shall you pray? To the God within you, says Theosophy; to the Spirit incarnate in man. And it shall be no matter of words, no seeking of gifts, no petition; it shall be a vivifying of the imagination to realize the center of being, a rising above the limits of selfhood, a stirring of the will to "bring down more of the Light to the aid of all that lives."

STUDENT

Answer II. To the first question the answer must be No, if the usually accepted meaning of the word prayer be taken. With most people prayer is a peti-

tion to some power supposed to be without, and for some personal benefit, either in the sense of receiving some supposed good, or being relieved from some supposed evil.

There are two factors usually overlooked by the advocates of personal prayer of this kind, namely, that the Universe is governed by law—absolute, unchanging law, and that man himself is innately divine, a creator, a potential god.

And the statement that the Universe is governed by law must mean that every part of it is so governed, that not only do the heavenly bodies move in strict accordance with the universal Law, but that every act and every thought is likewise under its guidance.

Furthermore, a knowledge of man's true nature shows that he himself has power through the law to make of his future what he will. And as a consequence instead of a dissatisfaction and discontent which prayer, as commonly indulged in, indicates, there will be reliance on the law and trust in one's own divine nature.

A discontented, lazy child at school cries and whines, does not wish to learn his lessons; or perhaps, when a little older, complains, Why should I learn algebra or study Roman history? A grown man or woman asks to have the path of life made smooth and pleasant, prays for success, freedom from sickness and trial, too often for the satisfaction of some personal desire. Two great nations, in all their churches, pray each to the "God of Battles" for success to its arms and the destruction of its enemy—the other nation.

All these are types of prayer, and contain their own answer—an intensification of selfishness. Each is a seed thrown out into the realm of thought which must bear fruit in action. Heredity and early training will account for the selfishness of a child, but when we become men should we not put away childish things? What right have we to ask for what is not our due? What true man or woman will? Is not the usual kind of prayer a complaint that God does not know what is best for us, and hence needs to be advised, impertuned?

But there is another kind. The prayer of the psalmist, "Make me a clean heart, O God, and renew a right spirit within me." And if read in the light of Christ's words, "Not every one that saith Lord, Lord, shall enter into the kingdom of heaven, but he that doeth the will of the Father who is in heaven," this gives a clue to what is true prayer.

For who or what is the father who is in heaven? Where is heaven? "The kingdom of God is within you,"—"There is no heaven save that which man makes in his own heart." Make heaven in your own heart, and the whole universe becomes heaven.

There is a power of unconquerable strength in the heart of each; awake that power, the strength of the divine will, and *will* what is good and *think* what is true. That, as I understand it, is true prayer according to Theosophy. Not the petitioning for any personal advantage or gain, but a doing of the Divine Will, the bringing of our personal desires and personal wills into harmony with the Divine Will; it is a trust in the Higher Law, a cleansing of the heart, a constant renewing of the right spirit within us. True prayer is to Will and to Do.

THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l O f f i c e P o i n t L o m a C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

The Poltergeist

WHILE Theosophy has neither wish nor need to court notoriety by the stale device of prophesying the second Advent, it can point to many signs now actually visible that fulfil former prophecies. For instance, we find both H. P. Blavatsky and W. Q. Judge speaking of the strange new qualities which the human organism would begin to exhibit as the consequence of turning a corner in its evolution; and no one can deny that new susceptibilities, greater nervous sensitiveness, strange maladies, and here and there mysterious powers or senses, seem to be becoming more frequent every day.

Indeed one of the declared purposes of founding the Theosophical Society was to safeguard the race during the awakening of these new susceptibilities; for it was foreseen that such an awakening, if allowed to take place in the midst of an atmosphere of selfishness and ignorance, with nothing to withstand it, would menace civilization with speedy disaster. In vindication of the truth of the latter statement one can point with confidence to the many dangerous psychic fads that are threatening sanity and physical and moral health; which, had it not been for the work of Theosophy would have gotten a firm hold on civilization. Illustration both of the awakening of strange faculties and of the incapability of ordinary resources to deal with them is afforded by what follows.

The papers report a remarkable case, occurring in the United States, of the phenomenon known in Germany as the "Poltergeist," a phenomenon the reality of which cannot be candidly denied by any rational person who has studied the history of the subject, so ample is the evidence, and so incredible is it that such stories could have been invented.

The victim is a boy of eleven who is attended everywhere by this mysterious prank-playing entity. When he plays marbles, the marbles shoot around, disappear, and are found in his pockets. He cannot run races, because the moment he starts, a shower of stones and dirt is aimed at him. When he goes to a store the jars fall off the shelves and break. He cannot play with the cat, because her fur bristles up and she flees when he comes near. The railroad will not sell him a ticket on account of the things that happen to a train when he is on it. The influence

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

MEMBERSHIP

cares naught for the efforts of ministers and prayer, which it treats with as much disrespect as ever.

And it is stated that the case is now in the hands of the Society for Psychical Research!

The necessity for people who understand such cases and how to treat them is evident, and will become greater when such cases become more frequent.

STUDENT

Light, the Creator

ACHEMIST has recently completed an extensive study of the changes produced in organic compounds by light. The compounds were used in 5 per cent aqueous solutions containing small quantities of uranium salts, which latter, it is stated, act as "catalysers"—that is, as bodies which promote chemical action in other bodies without being themselves changed—probably by absorbing the rays and transmitting their energy in another form to the surrounding medium.

All the solutions remain unaltered in the dark; but in the light a great variety of changes in the color, odor, and chemical composition were produced, often in a few minutes. Alcohols were converted into aldehydes, and acids into aldehydes or acetones containing an equal or smaller number of carbon atoms. Cane-sugar and other di-saccharides were inverted; and so on, the general effect being to convert relatively inert compounds into more active ones.

The word "light," as now used, stands for more than the agent of vision. The emanation or radiation, or whatever it is, upon which visibility has been found to depend, was found to have many other properties. It produced thermal effects and chemical effects. It was sorted out into groups, respectively thermal, luminous, and actinic; but these were found to overlap. It is clear that this mysterious influence that passes like a flash from sun to earth is the Mercury of a hundred messages, of which vision is but one.

We may restrict the term "light" to that which is visible to our normal physical eye, or use it to include rays of the same kind which are not thus visible. The former plan is irrational in that it draws an arbitrary line; animals may be able to see by rays which we cannot, or we may be able to see, with finer senses, by rays which do

not affect our ordinary senses. The other plan includes under the term "light" an indefinite number of kinds of rays.

Actinic action, from being a side-show in chemistry, is rapidly becoming the main drama. Where we used to think that the atoms and molecules arranged their social and domestic affairs by themselves, tumbling apart or together, as it were, in lumpish obedience to some mysterious dictator known as Inertia or Attraction—we now see that they can do nothing of themselves, and that even the lion and the lamb, so to say, will sleep placidly together until the busy invisible ray gets to work and infuses some energy into them. Our chemical universe is a lively stage full of actors, scene-shifters, and managers, in the shape of electrons, ions, and rays and waves of various sorts. Everywhere we discern invisible life, manifested in forms which we classify as kinetic and molar, the distinction between which two is indefinable. The one-sided evolution theory accepted today has sought to derive causes from their effects; to make a universe that is all actions and no agents; to build up intelligence out of something less than itself; but the facts have turned traitor to the theory. We find, as we might have expected, living agents everywhere. It was not the smoke that produced the fire, but the fire that produced the smoke. Our brains did not build our minds, but our minds built our brains. Matter and motion did not make light, but light has made both of them—so it seems nowadays.

The phenomena known as light, heat, electricity, etc., may be secondary in their crude manifestations; but essentially they are primary. The real heat, light, and electricity have created our physical matter and keep it going; they are not the products of it. And behind them stand *mind* and *will*, whose agents they are. Once that these almost self-evident truths are grasped, we realize the connexion between the ethics of great Teachers, and true knowledge of Nature. H. TRAVERS

Meeting of the Universal Brotherhood and Theosophical Society

Honored with Presence of Gifford Pinchot

"DISCOURSES on 'The Future of Theosophy' and 'Death as one of the Crowning Victories of Human Life' were the chief features of the meeting of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY at the Isis theater last evening. As this was the first meeting of the fall season given by the organization, an elaborate musical program was included and the theater was crowded to the limit. Beethoven's *Allegro con brio* as a piano solo, and *Barcarolle* from Gounod's *Tribute of Zamora*, were among the musical selections.

"Hon. Gifford Pinchot, chief of the forestry bureau at Washington, D. C., as a guest of Mrs. Katherine Tingley, and Mrs. Dunn, principal of the Râja Yoga Academy, and Mr. and Mrs. Ross White occupied Mrs. Tingley's box. Mr. and Mrs. A. G. Spalding were in another box.

"The speakers were Mrs. M. Tyberg on 'The Future of Theosophy'; Dr. Herbert Coryn on 'Death—One of the Crowning Victories of Human Life,' and Montague Machell, a Râja Yoga student, on 'The World's Present Outlook for Young Men.' From Mrs. Tyberg's address the following is noted:

"'Watchman, what of the day?' So one might word an inquiry into the future of Theosophy, for, as humanity proceeds in the ascent of the cycle of development which has opened, the light of the Wisdom-Religion will reach the hearts of mankind, and, kindling there the flame of compassion, will set the world aglow with the sunshine of brotherhood and truth. Theosophy itself, the mother of religions and sciences, is older than time; but in the night of ignorance from which humanity is emerging only the sublime faith and intuition of starlike poets and teachers have kept alive the hopes and ideals which, in the new day, shall find joyous fulfilment in the life of brotherhood. H. P. Blavatsky, bringing back the teachings of Theosophy, gave a dawn signal of this new time. It has been carried from land to land by her and her successors, William Q. Judge and Katherine Tingley. By giving humanity the teachings of Theosophy, rebirth, the divinity of man's higher nature, karma, cycles, as well as a history of the development of man and the universe, these teachers have unfolded the possibilities of the future, man's responsibility and power in building it, and especially by the teaching of rebirth and the law of cause and effect they have shown the links between humanity's present conditions and that future in which, Theosophy regnant, all the best of life can as last be manifested on earth. The future of Theosophy will be the gradual but effective awakening of humanity to the realization of these great teachings and the reconstruction of life on brotherhood principles. . . .

"'A beautiful symbol used in Theosophical work is the Lotus flower. On every seed is imprinted the picture of the perfect bloom. Theosophy says that in the heart of each man or woman lies the knowledge, the wisdom, the power, to live the perfect life; and the future of Theosophy is concerned with teaching humanity, every unit of it, to find this divine law.'"—San Diego Union

The Gaelic Language Movement---II

OUR interest in one of the most significant movements of modern times would be inadequate without recognition of its heroes and heroines. Ireland has just been plunged into tears by the passing of one of these, who had deservedly reached a place among the foremost leaders of the movement, and who has just sacrificed her youthful life to save that of a fisher girl.

The following tribute, from a Dublin paper, reveals so much of the deeper spirit of the times, awake and vibrant in the heart of Ireland, that all lovers of the true, the noble and the beautiful in human life, will peruse it with greatest sympathy.

"It is like a fairy-tale with an abrupt and awful ending. She was only twenty-five, and the record of her scholastic distinctions might seem almost impossibly brilliant. Intermediate triumphs were succeeded by University triumphs almost unexampled in her day. Her distinctions in Irish, French, German, Latin, Logic, Modern Literature, make an astonishing story. The crown came last year when she obtained her M. A. degree, winning first place, first-class honors and a £300 scholarship. She mas-

countless generations is untouched and unspoiled, and whence the view of cliff and promontory and old-time fortress and rock-shelters and stone-roofed bee-hive houses disclose memorial on memorial of the antique civilization of Eire. On the Great Blasket one can look back in a sense to the Milesians. It was in this remote and storied scene that the mind of Eibhlin Nic Niocaill took its last human flights. Some were all related to our own day and concerns. Only on Thursday evening last a note from her was read at one of the many committees that haunt the offices of the Connradh na Gaedhilge even in the summer. Less than twenty-four hours later she had given her life to save a fisher girl, and the week-end saw Gaeldom aghast at the news. She had endeared herself to the islanders . . . and they will tell the tale with perennial pathos to their children's children.

"The sorrow of it is beyond telling. Apart from all the painful accompaniments, the loss of such power and brilliancy, of so rare a mind in its first fine flowering, is inexpressibly pitiful. It is a severe test of one's philosophy of life. The mourners find it hard to realize that the earthly form and

DOLMEN AT HOWTH, IRELAND

tered Modern Irish in Loreto College; she continued the study of Old Irish in Paris, under M. d'Arbois Jubainville; and completed her German course in Berlin. On the continent, especially in Paris, where she lectured on Celtic subjects, her brilliancy and power were at once recognized. But no man or woman can ever have carried learning more lightly and gracefully. Of the hundreds of Gaels who came into contact with her in the last year or so, when she had entered on work from which we all expected so much, few probably remembered more than casually that she was amongst the ablest and most cultured minds of her day and generation. She was all gentleness, reserve, and kindness, while she set a noble ideal before the students and others to whom she lectured, and from whom she had such high expectations for Ireland. This year, apart from earnest labour as an Irish teacher, she acted as secretary of the Dublin Feis [Irish Musical Festival], and the testimony as to how well and truly she did the work was unanimous and emphatic. Only a fortnight ago she was elected on the Coisde Gnotha. Her educational and literary lectures in the brief period since she first appeared as a lecturer gave proof that a rare and highly-trained mind, with a clear and noble vision, had come to the help of the workers and thinkers in New Ireland. Irish Dublin had no young life that was richer and fairer in promise. Nature was kind to her in more than the matter of intellectual gifts. She looked a heroine, and with her grace and freshness of girlhood was blended a serene womanly dignity. Hers was an impressive and beautiful individuality that seemed to shrink from the idea of being individual at all.

"She went on a holiday to that isle of Kerry where all the speech is Irish, where the spirit of

role are after all but transient, incidental and relatively unimportant; that the great and permanent thing is the spiritual entity, which passes on to other roles and reaches in the limitless destiny. If we could see the scheme of things from the other side the earth-part a soul has to play would doubtless seem as brief and incidental as the swing of a pendulum or a part we make up for an evening's performance in a drama—something little and casual compared with the infinite Reality. For the moment the story of Eibhlin Nic Niocaill seems to come but to tragic anti-climax, the finale crude and inexplicable. In the subtler sphere to which all that was essential and immortal in her has passed, these limited earth-values and explanations do not count."

She had a firm belief in the future of Gaelic as a living language, and while an earnest student of old Irish, never ceased to perfect herself in its modern literature.

Thank heaven there are many heroes and heroines rallying to the Gaelic movement, bright souls who know and feel some mighty purpose stirring therein, even though it is sometimes hard, and very hard, to discern whither it is tending. There are even finer kinds of heroism than giving up one's physical life for another; such as the heroism of fighting for high ideals amid the stress and whirl of the world's life, surrounded not only by the petty cares of mere subsistence, but pursued on every side by those who have a vested interest in keeping the people in ignorance of their real nature and destiny, and whose weapons are from the demoniacal forge of fear. Those of Ireland's battling heroes are heated and wrought with the gentler, yet stronger and diviner fire that awakens joy, hope, nobility, and true brotherhood. IRISH STUDENT

TORRE DEL GALLO. GALILEO'S TOWER, AND VILLA ARCETRI, NEAR FLORENCE, ITALY
(VIEW FROM THE TOWER, SHOWING THE OBSERVATORY)

Galileo's Tower at Arcetri, Florence

THIS lovely spot is well known to all who believe in the right of freedom of thought, and who honor one of the most illustrious martyrs for Truth. It was here that the great mathematician, observer, and inventor, Galileo, spent the last eight years of his life in enforced seclusion, not only deprived of the honors justly due to the scientist who diverted the whole current of European thought from the narrow limitations of medieval ignorance and bigotry to the broad channel of free inquiry, but treated as a dangerous character—a person suspected of "heresy."

For a few years before his death in 1642 Galileo suffered from complete blindness, and could no longer enjoy the wonders of the heavens. Other misfortunes and bereavements fell upon him, and his life closed in a tragic gloom which must have been highly agreeable to the bigots who hounded him from society. Notwithstanding his keen sufferings during the years of incarceration, he continued his scientific researches, at first in astronomical physics, and finally in mechanics. Some of his most valuable treatises were produced during his blindness. In 1638 Milton, the great poet, visited him at Arcetri; Milton upon whom the same physical misfortune was to fall at a later time, and who bore it with equal fortitude.

Though Galileo could no longer use his telescope, we can be sure that he directed his two faithful pupils to show the poet all the marvels he had discovered in the sky, particularly

The moon whose orb
Through optic glass the Tuscan artist views
At evening from the top of Fiesole,
Or in Valdarno, to descry new lands,
Rivers, or mountains, in her spotty globe.

Pascarel gives a vivid word-picture of the present-day aspect of the Tower of Galileo and its surroundings. He says in part:

The world has spoiled most of its places of pilgrimage, but the old Star Tower is not harmed as yet, where it stands amongst its quiet garden ways and grass-grown slopes, up high amongst the hills, and sounds of dripping water on its court, and wild wood-flowers thrusting their bright heads through its stones. It is as peaceful, as simple, as homely, as closely girt with blossoming boughs and with tulip-crimsoned grasses now as then, when from its roof, in the still midnight of far-off time, its master read the secret of the stars.

Sir John Herschel says:

It is difficult to conceive what Galileo must have felt, when, having constructed his telescope, he turned it on the heavens and saw the mountains and valleys in the moon. Then the moon was another earth; the earth another planet; and all were subject to the same laws. What an evidence of the simplicity and magnificence of nature!

But at length he turned it again, still directing it upward, and again he was lost, for he was now among the fixed stars; and if not magnified as he expected them to be, they were multiplied beyond measure.

What a moment of exaltation for such a mind as his! But as yet it was only the dawn of the day that was coming; nor was he destined to live till that day was in its splendor. The great law of gravitation was not yet to be made known, and how little did he think, as he held the instrument in his hand, that we should travel by it as far as we have done; that its revelations would ere long be so glorious.

And yet for about two centuries after Galileo first saw the four conspicuous moons of Jupiter—the Medicean Stars, as he called them—and the phases of Venus, every effort was made by the highest authorities of the Church to prevent the truth from being known. The detailed history of the conflict between the forces of Liberation and of Obscuration that waged until about the end of the eighteenth century is one of the most instructive studies for the observer of human nature. The fight was bitter, and the last stronghold was not taken by the philosophers who knew Galileo was right, until the Spanish ecclesiastical authorities capitulated about a century ago. Then came the desperate stand made by the theologians in all camps against the revelations of Geology, and still later the furious effort to resist the general principle of Evolution in biology.

And yet—though Galileo may never have said it so dramatically—*E pur si muove*.

C. J. RYAN

The North Pole

THIS has at last been reached, it is said, by the Cook expedition, which left some two years ago. It is an event of significance. According to ancient teachings, adverted to in *The Secret Doctrine*, the land there, unlike the continental systems of the world, has never been submerged; it is the only land which prevails during the whole Fourth Round of evolution, and is called "the imperishable land." The climate has been tropical more than once.

Michelangelo, Greatest of the Florentines

THE two famous monuments in the now secularized sacristy of San Lorenzo, Florence, are considered to be the highest expressions of Michelangelo's genius as a sculptor. He worked upon them for nearly ten years, ceasing his labor in 1524. He never quite finished them, but it is generally believed by the best critics that this was intentional, and that he wished to leave something to the imagination of the spectator.

The Dukes Lorenzo of Urbino, and Giuliano of Nemours, the mediocrities honored by the great sculptor, were persons of no importance whatever; they merely happened to belong to the family of Lorenzo "the Magnificent." Our illustration shows the tomb of Lorenzo. His statue is usually called the "Penseroso," or the Meditative, and Michelangelo has succeeded in concealing the insignificance of the personality in the grandeur of the attitude. He sits like a Fate brooding over the unutterable woes of humanity. The face is almost lost in eternal shadow.

The symbology of the supporting figures of Dawn and Twilight has never been fully interpreted. Perhaps the subtle impression they give cannot be brought down to the crude level of word-description, for they are mighty, titanic, and yet not, like some of the master's work, exaggerated out of the human. The supporters of the other monument are called Day and Night, and Michelangelo has given us a slight clue to his meaning in a few lines which he wrote in response to a laudatory poem by Giovanni Strozzi, who said, speaking of the Night:

Touch her and see
Her eyelids lift, and hear her speak to thee.

The artist's reply was:

Caro mi è sonno, è piu esser di sasso;
Mentre che il danno e la vergogna dura
Non veder, non sentir m'è gran ventura:
Però non destar, deh parlo basso.

which has been rendered:

'Tis sweet to sleep, more sweet to be of stone,
While wrongs endure and suffering mortals moan;
No pangs I feel, no sin or shame I know,
Then wake me not—for pity's sake speak low.

Few figures in the world of art are more heroic than that of Michelangelo. He was cast, mind and soul, in a colossal mold, and when he died at the age of ninety he was still toiling at vast creative tasks, his life filled with gigantic plans and enormous responsibilities. Among the architectural schemes up-

on which he was engaged at the very end were the conversion of a portion of the baths of Diocletian into the church of Santa Maria degli Angeli, and the re-arrangement and decoration of the great group of buildings on the Roman Capitol.

Michelangelo always declared that he was architect and sculptor and that painting "was

not his business." Yet, strange facts, the series of paintings in the Sistine Chapel are not only considered by the multitude to be that work of his most deserving of immortality, but it was the only work of his life which he was able to complete as he had designed. It occupied four years and a half and, while begun with the help of assistant painters, was done by the artist practically alone for he early dismissed them all as incompetent or too set in their own methods to adapt themselves to his. Not until the autumn of 1512 was the whole work completed and the chapel opened. Then the artist's triumph was complete and he was acknowledged as the greatest of the Florentine school as he also proved to be the last.

Michelangelo deserves to be remembered not only for his art. His life was heroic in the extreme, in spite of a certain fitfulness of temper and a tendency to succumb to attacks of melancholy. He had a strong sense of duty to kith and kin, and for years endured the most pinching poverty and almost incredible hardship in the support of his father and brothers. The latter, it may be added, are known to fame, and justly, because of the selfish indifference with which they accepted this sacrifice.

Michelangelo never married, and we have no knowledge of woman's influence in his life—for his mother died while he was not out of infancy and he had no sisters—until he was entering his sixtieth year. It was then that he met Vittoria Colonna, widow of the Marquis of Pescara, a noblewoman, highly cultured, a poetess, of surpassingly benevolent and pure life, and whose friendship

for Michelangelo stirred hidden depths in his soul. It was then that he wrote those odes and sonnets which have been compared to the best of Shakespeare. The stern, masterful man, whose heart life had been withered by the selfishness of his brothers and father, and later crushed by the perfidy of a nephew in whom he had centered all his affection, was yet able to respond to the only unselfish appeal that had ever been made to him. All that was best in him blossomed during the twelve years of that noble and unmarred friendship.

One cannot but compare Vittoria Colonna's influence with the baneful but equally powerful sway exerted by the wicked selfish wife of Michelangelo's contemporary, Andrea del Sarto. History has immortalized both women; in the one case with love and admiration, in the other with contumely and scorn. STUDENT

TOMB OF LORENZO DEI MEDICI, FLORENCE, ITALY
(MICHELANGELO)

Elizabeth Barrett Browning's great poem on these monuments contains these noble lines:

"MICHEL'S Night and Day
And Dawn and Twilight wait in marble scorn,
Like dogs upon a dunghill, couched on clay
From whence the Medicean stamp's outworn
The final putting off of all such sway
By all such hands, and freeing of the unborn
In Florence and the great world outside Florence.
The Night has wild dreams in her sleep, the Dawn
Is haggard as the sleepless, Twilight wears
A sort of horror; as the veil withdrawn
Twixt the Artist's soul and works had left them heirs
Of speechless thoughts which would not quail nor fawn,
Of angers and contempt, of hope and love:
For not without a meaning did he place
The princely Urbino on the seat above,
With everlasting shadow on his face,
While the slow dawns and twilights disapprove
The ashes of his long-extinguished race
Which never more shall clog the feet of man."

The horse is prepared against the day of battle: but victory is of the Lord.
Proverbs, xxi, 31

THERE is no truly vital question of the day which does not, as it becomes more and more unfolded, show that the people, unconsciously, are asking for Theosophy.

There is a deep, earnest cry for a religion without creeds. Ernest Boars has written a book, *Do We Need A Creed?* John W. Chadwick, Sabatier, and many others have stirred up thought and feeling in this direction, and have met with a sympathetic response. Not only one by one, but many by many, the people are beginning to sense that creeds have been but millstones about their necks; and not irreligious and careless people only, but earnest and thinking ones are the pioneers who are leading the movement against dogmatism, which can not be held back. The pent-up force of ages is in it. The sleepers of the centuries are awaking, and in shaking off their lethargy, see more clearly every day that the world has been suffering for the Bread of Life.

Years ago Goldwin Smith, as he saw the old faiths crumbling, feared a moral interregnum as a result. This has been and is, side by side with the new life; but it is due to sensualism and materialism, the outgrowths of an unsatisfying faith, not due to those who have arisen in the dignity of their souls and thrown off the yoke.

But there are many aspects to every great question. And Dr. M. O. Stammer has recently voiced another wave of human thought in ably contending that it is a psychological impossibility not to have creeds. However simply they may be put, there must be articles of faith. People must believe *something*, and that is a creed. "Where," ask those who are rubbing their eyes after their long sleep, "where is the path in all this confusion?"

And now is seen the wonder and beauty of Theosophy. It harmonizes and unifies all phases of thought. This power alone, if thoroughly tested, would prove its claims to meet

A Creedless Religion

THE NIGHT BEFORE THE MOWING

ALL shimmering in the morning shine
And diamonded with dew,
And quivering in the scented wind
That thrills its green heart through—
The little field, the smiling field
With all its flowers a-blowing,
How happy looks the golden field,
The day before the mowing.
All still 'neath the departing light,
Twilight, though void of stars,
Save where, low westering, Venus hides
From the red eyes of Mars;
How quiet lies the silent field
With all its beauties glowing;
Just stirring—like a child asleep—
The night before the mowing.

Sharp steel, inevitable hand,
Cut keen, cut kind! Our field
We know full well must be laid low
Before its wealth it yield:
Labor and mirth and plenty blest:
Its blameless death bestowing:
And yet we weep, and yet we weep,
The night before the mowing.
Dinah Mulock Craik (Selected)

the needs of all time and of all conditions.

In 1875 H. P. Blavatsky brought Theosophy to the world, stating that it was as old as time, that it was the basis of every religion ever given to the world, and that unpopular as it was at first, the next century would recognize it with acclaim. Even now one can see the beginning of the fulfilment of this prophecy. As said above, every earnest call today can be seen by one who is familiar with it to be but a call for Theosophy. Take, for instance, the subject we are speaking of: "Religion has naught to do with dogma, it is something which must be lived"; quite true; many earnest people have settled that to their own satisfaction. And yet it is impossible for

thinkers not to believe in something; an attitude of negation ends in annihilation. Truth here again. And is or is not a belief a creed?

A true Theosophist, one who is not only so in name and profession, but Theosophical in every thought and deed, is truly religious. He believes "there is no religion higher than truth," and he searches the truth ardently and loves it better than his own desires. He seeks to purify his own nature, that he may have clear vision to see the truth and thus gain better knowledge of how to help others. A Theosophist is fortified with a wonderful, all-embracing philosophy which satisfies his reason, gives him a rational explanation of life, and enables him to live intelligently in harmony with the Higher Law. And yet the Theosophical organization is absolutely unsectarian, and its constitution demands "that all shall show the same tolerance for the beliefs of others that they expect for their own."

No one has a more assured faith than a Theosophist; but he is never asked to subscribe to a belief, except the axiomatic one of a belief in Universal Brotherhood, which Theosophy declares is a fact in nature, and scientifically proves.

The great Teachers who have brought the great Religions at different periods have given teachings, but never have they tried to force beliefs; for they realized that that would mean limitation, moral and mental stagnation.

Men are but half-formed beings as yet, so to speak. Suppose that anyone today is holding his highest possible conception on the great questions of being: shall he be chained down to these conceptions for centuries—for a day even? If he be truly aspiring will not his insight grow deeper and deeper? If he be free, natural, growing, will not the same formulation in words ever mean something more to him all the time?

But men, having within them a divine spark, cannot sleep forever. GERTRUDE W. VAN PELT

Woman's Work and Education

ONE of the most responsible positions in the educational world, commanding a salary of ten thousand dollars, and in the present instance almost autocratic in its powers, has recently been offered to a woman, Mrs. Ella F. Young of Chicago. As Superintendent of Schools of that gigantic city, the third largest in the world, Mrs. Young receives the same compensation as Superintendent Maxwell of the city of New York and will be given far more power by the Board of Education, which chose her unanimously after six months' consideration of the best educators in America.

The late President Harper of Chicago University used to say that he wished the power were his to compel every freshman to take one year of study under Mrs. Young before inflicting himself upon the long-suffering professors in the University. "I would at least be sure that they could read and write, that they could spell words of two syllables and count up to ten," was his comment. Which suggests one reason for mentioning this sincere and personally most unassuming woman in these columns.

Mrs. Young is something over sixty years of age and has taught school for forty-seven years consecutively. She has buffeted the storms of every public school grade from lowest to highest, with the additional experience of a district superintendency, a professorship in the Chicago University, and the presidency for six years of the Chicago Normal. The result of it all is the conviction on her part that the crying need of our present-day school system is more time spent on the "three R's," and less time wasted on fads and experiments.

This has been dwelt on again and again in these columns, the need of a better grounding in the "three R's," and it has been borne in upon the attention of a Point Loma Student with especial force the past week by a letter received from a certain person now holding a high elective office. Three misspelled words, "government" dissatisfied and "sistem" peered out from its pages, a fine indictment of the public school system of that State (though it may be doing better now, for this official passed through its portals, to wit, the High School, some years ago). It strangely sustains the position once taken by the Student mentioned with the School Board which was pre-

siding over the educational destinies of the official in question.

Briefly stated, the facts have a bearing as proof of the long-standing need of educational reform along the lines advocated by Mrs. Young and advocated by Katherine Tingley many years before she founded the Râja Yoga system of education. This Student, after graduating from the High School in his home city was asked by the Board of Education to undertake the Senior Classes of a certain

drill in connexion with every class. Within a week the news of this reached the regular teacher who was not too ill to consider the innovation a serious reflection upon her own methods and the result was a request from the Board of Education that the substitute teacher confine himself strictly to the "regular studies." Within half a day a list of the misspelled words — words that any Râja Yoga child of ten would feel disgraced not to know perfectly — was in the hands of the Moderator of the Board, together with the teacher's statement of his reason for the innovation. It might as well have been sent to the East wind, and the teacher, after a month's battle, gave up his position, worsted. But time and the light of reason seem to have been in the field since that experience of some fifteen years ago. The official whose fatal letter would be discreditable to a child was a member of that very class — one proof of the awful logic of facts. (One cannot wonder at H. P. Blavatsky's old saying that "Facts are pitchforks"). And during the very week when a whirl of reminiscence was stirred up by the receipt of the letter, the Chicago Board of Education, after many years of experimenting and six years of stormy scenes in pursuance of sane ideas, has calmly and submissively placed the destinies of its schools in the hands of a woman who — think of it! — believes that young America should be taught to read, write, count, and even add a column of figures correctly! Verily, times change, and this is not the only one of a number of sane and old-fashioned ideas that bids fair now to be elevated to the dignity of a "principle."

The corner-stone of the Râja Yoga system of education is character-build-

ing, yet pupils cannot pass the required tests without properly disciplined brains. And to one whose brain is clear and positive in its quality, any haziness as to the correct spelling of simple words is as unnatural, in fact as impossible, as a slovenly walk and a shifty, sneaking glance to the virtuous and truthful man or woman. The whole nature must be trained, not part of it, and each part has a strong reflex influence upon the whole. Better a generation that cannot tell the difference between the Discobolus of Myron and the mantissa of a logarithm than one which, through ignorance or indifference, condones illiteracy of the type mentioned.

teacher who had been seized with what threatened to be a protracted illness. The classes comprised Virgil, History, English Literature, and one study of which memory has not retained account, this mention being made for reasons which will appear. At the end of the first week, out from the pages of the "compositions" handed in stared something like two-score of the simplest words misspelled ("government," "retoric," "Eclogue" from a Latin (!), "improveing," are among the few remembered).

It was a question what to do until the Gordian knot was (supposedly, by the inexperienced teacher) cut by instituting a spelling

A PEACEFUL COUNTRY SCENE

Uncle Solitude---A Reminiscence

THE influences of noble lives, which in childhood have seemed to us very humble, are often the guiding posts of our own lives. It is only when we become responsible beings that we fully appreciate them. We are able to surmount the difficulties in our paths more easily because of the lessons instilled into our minds by these noble souls, and life is easier because they helped to open our understanding.

I remember when Uncle Solitude, as we learned to call him, first came, and how gladly Father welcomed him. I was a boy about twelve, and little Elizabeth, ten. He was a small quiet man with a slight limp. When I asked Father about him, he said, "Robert, this old friend has had a great sorrow in his life and a great misfortune, for which I was partly to blame; he has done me a service which I can never repay. As long as he lives he is welcome to share my home. Do not trouble him with questions."

He chose a sunny room in the south-east corner of the big barn, and in no time had one end fitted up with his bed, table and chair, while the rest was turned into a workshop. Here I was trained in many useful ways though I did not realize it until long after. He kept the place in splendid repair, and Mother had only to wish for a new shelf or a handy box, and they were forthcoming. He always found time to make some new contrivance for little delicate Elizabeth's couch, and the child loved him with all her heart.

On Saturday afternoons, Uncle Solitude and I roamed the woods, and it was then he taught me so much about nature. But on Sunday he would wander off on the edge of the bluff and sit there for hours gazing at the view shown in the cut on this page. I learned never to disturb him then and would leave him alone unless he called me. He loved the old farm and taught me to love it. The beautiful wooded hillsides held a wealth of Nature's treasures. Uncle Solitude was always the one to find the first spring flowers; the dainty pink, lavender, and white hepaticas which grew be-

side the old snow banks on the north side of the ravine. How beautiful and fragrant they were, smiling up at us on their little fuzzy stems. Elizabeth was delighted when she saw them. Later, we gathered the butter-cups and violets, funny little dutchman's breeches, jack-in-the-pulpit, and the sweet white may-flowers, growing under the umbrella-like leaves. Sometimes we found a rare orchid and Uncle Solitude would whisper "Let us take it to Elizabeth." Indeed, the principal thought in these expeditions was to gather treasures to take to the patient little child. I think he used to talk

STRONGER LESSONS

HAVE you learned lessons only of those who admired you, and were tender with you, and stood aside for you?

Have you not learned great lessons from those who reject you, and brace themselves against you? or who treat you with contempt, or dispute the passage with you?

Walt Whitman

to Elizabeth perhaps more than to anyone else, and I know now, although I did not know then, the hope and courage he awakened in her little soul which eventually made her life one of helpful inspiration to all who knew her.

As the summer came on, Uncle Solitude kept the table supplied with delicious wild blackberries from bushes which over-hung the dry runs, and gathered spicy red haws and Mother would make jelly with all the flavor of the wild-woods in it. Then came the nuts in the fall; white hickory, black walnuts, and butternuts from the trees in the hollow, and hazel-nuts from the bushes along the roadside; the bitter-sweet berries and feathery clematis; I cannot begin to tell of all the treasures that were in the woods about the old farm. Our little feathered friends, the birds and butterflies of the day time, and owls, whip-poor-wills and katydids of the night, lent such a charm to my boyhood. They were all my friends and,

as Uncle Solitude taught me, had their part to play in my life as helpful inspirations. Each living thing great or small on its way upward toward perfection, and each little life, was, he used to tell me, a part of the very same life in me which was also a part of the great whole. He awoke a great feeling of responsibility in me which has made life mean much more ever since.

It was only afterwards I learned how he had helped little Elizabeth to bear her troubles. Wheeling her out under the big maple tree where she could look at the lovely view up the river valley, over the tops of the tall trees which covered the ascent of the four hundred feet of bluff on which our farm land stood, he talked gently to her and taught her many things.

When I was about seventeen we noticed that Uncle Solitude was short of breath and did not take long tramps about the farm as he used to. He never complained, and when Father went to him and tried to find out if he could do anything to help him, he only said "No, my friend, you have done all anyone possibly could do to make the old man's days happy ones."

One morning not long after that, he did not come to breakfast and when Father went to look for him, he found him peacefully sleeping his last sleep. He had left a tender message for each; had asked if I might have his workroom; his few good books he left to Elizabeth. Among the well-worn books we found Madame Blavatsky's *Key to Theosophy*. Here was the secret of his beautiful life. He had made Theosophy a living power in it and each of us had felt this and had been touched by its influence without knowing what it was.

Since I have joined the workers for humanity at Point Loma, the Headquarters of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, of which Madame Blavatsky was the Founder, I realize that it was dear old Uncle Solitude who started me on the path to this great opportunity; and my gratitude to him is very great.

THE CHILDREN'S HOUR

Lumbering in Sweden

THE veterans of the forest have been doomed to fall. Already have they been marked by the lumberman's axe. The little trees shiver, when they hear of the fall of the tall, majestic pine-trees. But the pines stand there, strong and brave. "Do not fear!" they say, "grow strong and tall, and when your turn comes to go out into the world and serve humanity, go with joy."

In November or December, when the trees are covered with white, glittering snow, the lumbermen come gliding on their snowshoes or "skidor," with their axes and saws. The cold, clear winter air resounds with their song as they go to work, making log-cabins to live in and clearing roads for the transportation of the lumber. And then the timber-cutting begins. Krisch, krasch, there they fall, one after the other, the giants of the forest; their branches are cut off and they are made into logs of different lengths.

The tinkling of bells is heard from a distance, and soon a long row of double sleighs, drawn by quick, lively horses, comes gliding over the smooth, icy roads. The lumber is chained, as many as ten to twelve logs, eighteen feet long, on each sleigh, and load after load is sent down to the nearest river, where they are piled up to wait until the sun melts away the ice.

As soon as the spring tide comes rushing down from the mountains, the floating of the lumber is begun. In the large rivers with abundance of water no special arrangements are needed. The logs are carried down to the sea by the streaming water. But in smaller rivers, dams very often have to be built to regulate the water supply, and here and there it is necessary to build floating channels to escape precipitous streams. The men follow along on the shore keeping the logs clear from land with long boat-hooks or driving poles and preventing them from being blocked. It is a hard and often dangerous work. They have to be brave and strong and wide-awake, these men.

At last after many knocks against rocks and stones the timber reaches the saw-mills by the sea shore. There it is sorted according to size. Some of the logs are exported as "round timber," others are sawed in the mills and made into boards of different sizes. All over

"WHAT lies at hand
Why seek afar
In distant star
Or far-off strand?
Where children are
Is Fairyland."

the world they are shipped; some to Germany, England, and France; others finding their way to Africa and Australia.

Wherever they go, they carry with them the strength and vigor of the Northern woods. Every little board remembers that it is a part of a tall, majestic pine tree and does its duty, be it ever so humble.

Red Coral

THE pretty red and pink coral of which beads and other trinkets are made, like the branching white coral of the coral reefs and coral islands, is the bone-house of a busy colony of little animals known as polyps. They live down in the sea and get the material for their coral home from the sea-water.

The polyps are very busy workers indeed. They are industrious, and painstaking and work together in peace and harmony. Hence the home that they build to live in is very beautiful both in color and material, and they themselves are among the prettiest of the little creatures of the sea. The hard red substance of which their house is made has been greatly admired from the most ancient times. It is known as "precious coral" and is valued for its beauty just as diamonds and rubies are.

When it is growing down in the sea, the precious red coral looks just like a living plant. The red bone-house is all covered over with a fleshy coat like the bark of a tree. It has round knob-like places that look like the leaf-buds of a tree in early spring. Each knob has a tiny hole in the center, from

which radiate eight little lines. In this thick covering live the little polyps.

When all is still down in the water, and the polyps are sure there is no danger lurking near, slowly the little round knobs begin to unfold. From each once, a thick white stem pushes outward, the end blossoming into a beautiful starlike flower. This is nothing else than the little polyp itself.

Until within the last one hundred and fifty years, it was thought that the red coral was a plant, especially by those who were so happy as to catch a glimpse of the pretty coral flowers. But it is now known that the "flowers" are no flowers at all, but little animals, the polyps so-called, and the admired and sought-after red coral is the polypdom, the homestead which the polyps build by their united efforts.

Red coral grows in nearly all parts of the Mediterranean. It is as hard as marble, and has beautiful delicate lines upon it. It will take on an exquisite, high polish. The ancient Greeks loved it for its rich color and luster. They called it the Daughter of the Sea.

THE MYSTERIES OF THE HEART DOCTRINE

PREPARED BY
KATHERINE TINGLEY
AND HER PUPILS

The Theosophical Book *of the* Twentieth Century

Tells the story and the history of the Theosophical Movement.

The prices are \$2 in cloth and \$1 in paper, which barely cover the cost, for it is printed and bound, not gaudily, but with such carefulness and thoroughness of art and craft as to make it unique among modern edition books.

ORDER FROM THE
THEOSOPHICAL PUBLISHING CO., POINT LOMA, CAL.

Isis Conservatory of Music OF THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY POINT LOMA, CALIFORNIA

Personal applications and inquiries received every Saturday
by the Secretary at SAN DIEGO BRANCH

ISIS HALL, 1120 FIFTH STREET

between the hours of 9 A. M. and 4 P. M. Full particu-
lars will be sent by mail upon application to

The Revolution in Science

PEOPLE hardly realize as yet what a tremendous revolution is taking place in science; for no balancing up of the books has yet been made and the new views have not yet sent down their waves deep enough to disturb the quiet undercurrent and sediment of established theory beneath. And so we are teaching in our schools the old tale, while the scientific journals and daily press are recording views that completely subvert many of the old ones.

For instance: in the *Scientific American Supplement*, translated from *Cosmos* we find a paper which concludes as follows:

It appears to be proved by observed facts that the sun furnishes the primordial cause of all terrestrial phenomena, and that this cause is not connected directly with the light and heat of the solar surface, but is most probably electrical.

Elsewhere the writer says:

The electrical influence of the sun . . . is manifested very probably in a great variety of forms: static, magnetic, electro-magnetic, ionization, cathode and anode rays, Roentgen rays, Hertzian waves, etc., etc.

A Revolution of Old Theories

Now this completely stultifies all theories which attempt to explain terrestrial phenomena simply by the aid of terrestrial forces plus the heat and light of the sun. It introduces into the calculation a new and immensely potent force—the electrical influence of the sun. And this new god is as hundred-handed as Briareus of old. Like some illustrious potentate of the Hindû Pantheon, he sits on a glowing orb in space and wields in his numerous hands—not the magical weapons of Siva, but the waves of Hertz and the rays of Roentgen. On that dim throne where of old our grand-sires thought they desecrated the serio-comic figure of Jehovah raining alternate ire and benison upon earth, we now see this new Ineffable, benevolently ionizing all creation, and distributing anode and cathode rays upon rich and poor. Verily it has been a season of de-thronization for the hoary old potentates, whether on Asiatic thrones or in the unending wastes of interstellar ether.

It is not a little remarkable that systems which seemed to be so complete in themselves should be called upon to accommodate such revolutionary intrusions. The appearance of a cat among mice is nothing to the awful appearance of one-tenth of a grain of radium chloride in the midst of Lord Kelvin's secular-cooling-theory of the age of the earth. And the orderly scientific housewife who may have just gotten all her traps in order in the realms

The Advent of Life

of cosmic theory, will now be called upon to take everything out of the cupboards and make room for this latest arrival from the sun.

The weather bureau may chart the distribution of pressure and telegraph the movements of storms; but if the sun is going to send down a Hertzian wave or enter upon a fresh bout of ionizing without warning, the experts will have to content themselves with looking out of the window or with retrospective predictions.

But seriously, what a revolution in thought! And what a return to ancient teachings! But where else can facts lead to but to the truth? Empty space has been filled in with an order of substance so richly endowed with properties that it must make our terrestrial matter envious. It positively teems with gods—electric, Hertzian, cathodic, etc. This omnipresent invisible matter is the old "universal light" or "magic agent" of ancient alchemy; our physical matter is nothing but a scum on its surface—nay, perhaps it is only a hole in it. In it reside all the forces and causes that operate on our earth—forces and causes which yesterday were supposed to reside in our matter itself.

The Contents of "Empty" Space

So far as definite explanations are concerned we are in a state of chaos. Electrons have been imagined as if they were particles of matter obeying the dynamic laws of large masses. The primary concepts—of space, volume, mass, etc.—have as usual been confused. We talk about waves in a fluid until we forget that neither waves nor fluid are as yet more than convenient hypotheses, which may be rejected at any time in favor of more suitable ones. We need new generalizations and formulations. The conception of the universe as a series of points extended in three perpendicular directions is not ample enough. The problem of "action at a distance" still confronts us; according to physics it is both impossible and the only kind of action there is. If we suppose atoms we must suppose gaps between them; and what, O tell me what, is a gap? What is it made of? How can we bridge it when the bridge itself is only a row of gaps?

Can we eliminate the three-dimensional concept from our imagination? Obviously the answer can only be found by an inquiry into the nature of our faculties. We can ascertain facts, and we can formulate their interrelations as best we may by means of various mental pictures; but for an explanation of the causes behind the manifestations we must explore the realms of consciousness. STUDENT

A Forced Revolution in Thought

How Science Echoes 'The Secret Doctrine'

TO show how Theosophical ideas are permeating the air, passages are quoted below from a paper by a man of science in a scientific periodical, and from *The Secret Doctrine*, written by H. P. Blavatsky in 1888.

It is quite possible that the dawn of the human race was contemporaneous with the ancient reptiles of the later Cretaceous period, and that the origin of the folklore referring to terrestrial, marine, and flying dragons and other monsters of strange forms is to be found in the traditions handed down by mankind from generation to generation.

The Eocene strata overlie the Cretaceous, and as some of the oldest human skulls have been found in the more recent Miocene and Pliocene formations of California, and as this part of America was probably connected to China at one time, it is possible that the Imperial Chinese emblem of the Dragon, which is generally represented as a reptile with wings, had its origin in these traditions, which have since spread westwards.—Stanley C. Bailey, A. M. I. C. E., F. G. S., in the *English Mechanic*, Aug. 13

SECONDARY: Triassic, Jurassic, Chalk or Cretaceous.

This is the age of Reptiles, of the gigantic Megalosauri, Ichthyosauri, Plesiosauri, etc., etc. Science denies the presence of man in that period. If so it has to explain how men came to know of these monsters and describe them *before* the age of Cuvier? The old annals of China, India, Egypt, and even of Judaea are full of them, as demonstrated elsewhere. . . .

This, then, is the age of the Third Race, in which the origins of the early Fourth may be perhaps also discoverable.—H. P. Blavatsky, in *The Secret Doctrine*, Vol. II, p. 713.

On Babylonian tiles, and especially in old Chinese and Japanese drawings, in the oldest pagodas and monuments, and in the Imperial library at Peking, many a traveler has seen and recognized perfect representations of Plesiosauri and Pterodactyls in the multifarious Chinese dragons. . . . How could the ancient nations know anything of the extinct monsters of the carboniferous and Mesozoic times, and even represent and describe them orally and pictorially, unless they had either *seen those monsters themselves or possessed descriptions of them in their traditions*, which descriptions necessitate *living and intelligent eye-witnesses?*—*Ibid.* p. 206

In the Karoo formation of Triassic age in Cape Colony the remains of a peculiar reptile known as *Pariasaurus* or *Hatteria* (*Sphenodon Punctatum*) have been found. The top of the skull of this animal contains a cavity known as the "pineal foramen," in which there was a single large median or parietal eye. . . . It is a curious fact that the existing Tuatera of New Zealand has a rudimentary median eye with a nerve under the skin at the top of the skull, close to the two normal eyes. A similar stalked median eye is found in the Monitor, the skeleton of which, 30 feet in length, has been found in the Pleistocene deposits of Queensland. The remnants of this median eye, called the pineal gland, is found in all the higher vertebrates.—S. C. Bailey, as above.

It is asserted upon the authority of Science, and upon evidence, which is not merely a fiction of theoretical speculation this time, that many of the animals—especially among the lower orders of the vertebrata have a *third eye*, now atrophied, but necessarily active in its origin. The *Hatteria* species, a lizard of the order *Lacertilia*, recently discovered in New Zealand . . . presents this peculiarity in a most extraordinary manner; and not only the *Hatteria punctata*, but the chameleon, certain reptiles, and even fishes. It was thought, at first, that it was no more than the prolongation of the brain ending with a small protuberance. . . . But it was soon found to be more than this. It offered—as its development and anatomical structure showed—such an analogy with that of the eye, that it was found impossible to see in it anything else. There were and are palaeontologists who feel convinced to this day that this "third eye" has functioned in its origin, and they are certainly right.—H. P. Blavatsky, in *The Secret Doctrine*, Vol. II, pp. 296-7.

While it is gratifying to Theosophists to find the ideas which they have cherished and contended for gaining ground, it would be still more gratifying to them if they encountered the name of H. P. Blavatsky a little oftener. For these very views were put forward by her at a time when no man of science would have ventured to put his name to them. For a learned authority to have declared in a well-known periodical, 20 years ago, that man was contemporary with Mesozoic monsters, and that the Chinese dragon was probably copied from those monsters, would have been to ruin his reputation for competence, if not for sanity. Yet H. P. Blavatsky said those very things in 1888. Would she not have been gratified, had she lived to see these ancient teachings thus sanctioned by scientific authority!

No doubt the writer from whom we have quoted will be equally gratified to learn that his views were shared by another champion of the truth, and that they are not so revolutionary after all, having been put forward 20 years ago.

The attitude of the organs of public thought towards H. P. Blavatsky is still one of silence, broken occasionally by a recrudescence of the jeers and calumnies with which she was greeted when she first began her work. But everywhere there is ample evidence that her writings have powerfully influenced the thought of the age, not only through the invisible channels of thought, but sometimes by more direct means.

The CENTURY PATH has pleasure in advising scientific writers and their readers that they will find in the works of H. P. Blavatsky an ample fund of information on the lines they are pursuing; and if they do not care to have their names associated with that of H. P. Blavatsky, they can at least profit by her teachings. Her aim was not recognition, but service.

The article from which the quotations are made is on the Carboniferous and Mesozoic reptiles. The earliest remains of reptiles, we are reminded, appear in the Coal-Measures. They increased in size, until in the Secondary period they reached their maximum dimensions. The measurements of a skeleton of *Diplodocus carnegii*, found in the Upper Jurassic of Colorado, are given as follows: head and neck, 23 ft. 3 in.; body, 12 ft. 4 in.; tail, 49 ft. 2 in.; total length, 84 ft. 9 in.; height at shoulder, 11 ft. 5 in.; height at back, 12 ft. 5½ in. Some of these animals must have weighed 20 tons.

After this they decreased, until now we have only a few dwarf remnants. The *Hatteria* of New Zealand is the only living reptile, says the writer, that is closely related to the ancient ones, the majority of present-day reptiles being probably descended from a much smaller race of animals. During the voyage of the *Beagle*, Darwin studied the habits of some large marine lizards, named *Amblyrhynchus crustatus*, found on the rocky shores of the Galápagos Islands, living almost entirely in the sea. They are from 3 to 4 feet long, black, with a serrated ridge on the back, long compressed tails, partially webbed feet, swimming with a serpentine movement of body and tail, the legs being pressed against the sides. They are the only marine lizards now known to exist.

H. P. Blavatsky cites this case of the degen-

eration of the marine and terrestrial saurians as conflicting with the *accepted* biological theory of evolution; and quotes other cases of degeneration among the animals in illustration of the point that both backward and forward movements take place. In the same way the present man is physically but a dwarf remnant of gigantic human races that lived contemporary with the gigantic animals. And this hinges on to the point about the Third Eye.

Many of the structures found in animals are copied from man—another reversal of biological theories of evolution. This of course does not mean that the animals descended from man by procreation; it means that the astral models on which they are built were derived from the human kingdom. The third eye in the older saurians, now found atrophied in existing animals, was the physical analogue of the Third Eye in man. In the animals it was an organ of physical vision; but in the man it was a spiritual eye as well. Allusion to it is found in the myths of the Cyclopes. It is now represented as a rudiment in the pineal gland. Much information and many valuable hints are given in *The Secret Doctrine* on this and allied questions. The subject is very important from its relation to the question of man's spiritual powers and the great advancement of some of the human races that have preceded us. STUDENT

Signalling Mars

A CONTEMPORARY prints another suggestion for signalling Mars, one which from its simplicity will at once put the others out of court. It rests on the fact that the earth sometimes lies exactly between Mars and the sun. All that is required is to bore a hole a few miles in diameter right through the earth and fit it with some sort of curtain or other easy device for blocking the transit of light. Messages could be transmitted somewhat in the Morse manner by rapid drawing and withdrawing of the curtain.

Another advantage of this method would be its contagiousness. Inhabitants of the moon and other planets would quickly seize the idea. "One can readily understand," says the inventor, "how the system might be also put in operation on the moon, if the lunatics would only bore a hole through which the sun might shine when the dark side of the moon was towards us and then arrange a device for cutting off this beam at will."

It is never from orthodox science that the really great inventions hail. The tenderfoot finds the gold. STUDENT

The North Pole

FOLLOWING close upon the announcement of the alleged discovery of the North Pole by Dr. Cook came the announcement that it had also been discovered by Commander Peary. Further details of both claims will of course be awaited with interest. An interesting incident was President Taft's reply to Commander Peary, saying he did not know what he could do with the North Pole! As it is not yet settled who ought to be the donor, the caution of this reply was commendable. There will be plenty of work for future explorers in mapping-out the land of the neighborhood, and in finding whether the actual theoretic pole is situated in land, in a lake, or in an arm of the sea, etc. STUDENT

Some Views on XXth Century Problems

Spiritual False Noses

OUR old friend "Divine Mind" is turning up in an extraordinary number of new disguises in these days, vigorously repudiating in each of them the slightest connexion with former appearances.

But its presence is always unmistakable; there is one never-failing diagnostic mark. The chief and most attractively displayed of the powers it advertises itself to possess — though this may not be mentioned *first* — is that of *healing its possessor's diseases*. However "Divine" it may be, it never takes its attention very long from the liver and other internals. Their only serious rival is Wealth. Find it, develop it, and it will attend in serial order to (1) your liver; (2) your purse; and then perhaps, incidentally, a good way off, to (3) your morals.

One of the most recent of its aliases is "Cosmic Consciousness." But the very name of one of the books in which this is assumed reveals its identity — *Health and Wealth from Within*. The description is at first rather promising. As it awakes, we learn,

Man sees himself not as a material being of flesh and blood, but as something which existed before birth, and which will survive after death.

We read on; presently comes this:

There is also a growing consciousness of the power of the soul to *heal the body*.

There is the hall-mark.

In another book it is "The Transcendental Self," and we read:

As this consciousness awakes there comes there-with a recognition that material poverty is no part of Divine Organism and with this recognition the money you will need flows naturally in your direction.

But we are solemnly warned "not to let this (the cash) be the basis of aspiration."

The pity of it is that there is a Divine Mind, a Transcendental Self, a Cosmic Consciousness; and that these terms, which might come to mean something real for modern human aspiration, are being abused before ever they have been well used. The Divine Mind of each of us is ever beckoning us upward and its light shines upon the steps by which we are to climb. But those illumined steps may actually be the very poverty or sickness which "Divine Mind" is invoked to abolish, conditions necessary for the larger growth. They may be spiritual invigorators, educators, guides, sign-posts indicating the weak places of character. The down-coming message is to *endure* these things when ordinary sane effort proves fruitless against them, having faith that when their use has passed away they too will pass, having faith that Divine Mind will judge of the right coming of that hour. Divine Mind cannot be reached except through such a trust.

The other way of effort has its automatic penalty, not to be escaped. Suppose that will and imagination are at last raised to the morbid sort of tension necessary for the suppression of bodily sickness or the gratification of some other terrestrial desire, the tension which the practices and thoughts of these systems may be made to induce; what follows? Always this: that the dread of sickness, laid

latent even for years as it may be, the dread of death, have secretly mounted *pari passu*; that any other life than that of matter has become inconceivable; that "spiritual life" is now merely this material life gilded and tinted; and that as the hour of death does actually approach, the magnified fear of it comes forth like a delayed phantom; shadows the last years deeper and deeper, filling them with the sleepless crave for life, life, life; and makes the last moments a very climax of terror. For the Divine Mind has long before withdrawn its unused and therefore unavailing light.

STUDENT

Supermanhood

THE Nietzsche student, a more and more frequent figure in our time, believes himself to be able to look farther along the perspective of the lines of evolution. Having become, as he thinks, past master of what the doctrine of evolution has to teach, he is able, as he thinks, to move on further.

But then he shows himself to have never seen the path at all. For the whole method of evolution is the combination of individuals to make a higher one; it is an ethical process slowly working out. The Nietzsche ideal rests on the selection and consideration of moments when the process is in suspension.

The single unit, say the amoeba in the pond, combines with others into a greater unit. It loses nothing of its individuality but acquires in addition another plane of consciousness, the plane of the richer whole of which it is now a part. It is all the self it was but now also another self. To break loose from the new whole in order to "realize its individuality," is merely a reversion whose penalty is that it shall become the food of the organism of which it might have still been a part. Its only chance of super-cellhood was to remain the part.

The process is visibly the same whether we look far back or far forward. The primeval units combine and recombine, and at last we have the corpuscle, the atom, and the molecule of chemistry. Forward, the same integration is in store for men. Those who think they can permanently stand out and flower into supermen on their own account, are dreaming that they can defy the universal law, resting their defiance on the transient inchoateness between two stages of integration. Supermen there will be, beyond any dream of Nietzsche; it is in the promise of life for us all and a few have achieved it; but we shall not realize it by trying to defy the force that has made our very bodies what they are. We must work with it, developing every power in the service of an ideal organism now in process of formation.

Evolution, looked at in its longer reaches, is the realization of brotherhood between units; it is an ethical process and a force to prove finally irresistible. Full alliance with it is the condition of full growth. Acquired powers, their lesson being fully learned, may be gradually disused, the fruits of their use being fully retained; their partial or entire disuse being the condition of the perfecting of some one *special* power for each. The musician,

having learned all the instruments of the orchestra, settles upon one and in becoming perfect there, permits the rich being and performance of the whole. The Nietzsche superman is the solitary big-drum-player who, having slain his comrades, bangs his parchment in the waste. But nature is bigger than he and will not permit him. To become great one must become that which is great, the conscious force of evolution. That becoming lies through brotherhood in thought, in aspiration, in action. It is the only path to the supermanhood which nature will permit and encourage. It is the path which every religion has enjoined, for the founders of all the great religions were supermen. The Nietzsche people must betake themselves to a sane study of evolution and an unaccustomed facing of facts as they are.

STUDENT

The Armies of the Morphined

STATISTICS of the morphine evil would be probably impossible to prepare, but we get an occasional hint of what they would indicate. During a recent audit of the accounts of an almshouse in Pennsylvania it turned out that during the first six months of this year no less than 30,000 doses of morphine had been supplied to the resident inmates — not as medicine but to meet the demands of the habit. The penalty which the staff would have had to face for withholding it would have been so many cases of mania and intense depression with a good proportion of deaths. It was thought better to turn a half blind eye upon the evil.

Unfortunately the report does not say what was the proportion of inmates *with* the habit to those without it. But whatever that proportion was, it might probably be taken for our people as a whole.

Part of this is the fault of the medical profession with its ever ready syringe. It has never yet been educated to complete knowledge of the *after* effects of one dose. De Quincey has put on record that during his attempts to free himself from his vice it was on the *fourth* day of abstinence that his struggles were most severe. Other careful self-observers have corroborated, some of them adding that it is not until the *seventh* day has passed that physiological feeling comes back to the normal. Anyhow the one dose means not one but several subsequent days of depression, the depression deepening during the first three or four of them. Yet frequently the ordinary practitioner will cheerfully begin his treatment of a case of pneumonia with a hypodermic dose of morphine that would never be even suspected of having contributed to a collapse separated from it by three days.

Experiments show somewhat the same prolongation of effect with other narcotics. The lengthening of the word-response after a dose of alcohol, has been found to continue for as much as three days, mental reflex not reaching its normal speed until about the fourth day.

Morphine may at present be a medical necessity, but until it is superseded every use of it should be considered as well from the ethical as the therapeutic standpoint. M. D.

THE AKROPOLIS, ATHENS

The Akropolis, Athens

NOTHING could be more appropriate than the situation of the Akropolis of Athens. It dominates the city as completely as Greek art and literature have dominated the West. Representing the highest perfection of art, focussing the religious and patriotic ideals of the most advanced European culture, and surmounted by the Temple of Wisdom personified—Pallas Athene—it was a constant and visible source of inspiration to the Athenians.

The walled summit of the Akropolis contains three principal buildings, and is approached on the west by a magnificent white marble entrance porch called the Propylaea. It is visible in the engraving at the left. Three temples: the Parthenon, dedicated to Pallas Athene, the Roman Minerva; the Erechtheium, the tomb and temple of Erechtheus, agricultural hero and deity of Attica and protégé of Athene; and the small temple of Niké Apteros, the Wingless Victory—are contained within the walls. Athene being the principal deity of the land of Attica, her temple was naturally the finest. It is related that Zeus had decreed the sovereignty over Attica to that deity who should bestow on the land the most useful gift. Poseidon (Neptune) created the horse, but Athene produced the olive-tree and gained the victory.

The Parthenon was erected by Iktinos and Kallikrates about B. C., 440 on the initiative

of the illustrious Perikles, upon the site of an older temple destroyed by the Persians under Xerxes. It is 227 feet long by 101 feet broad, and was in a good state of preservation until the seventeenth century, when some gunpowder which was stored in the building exploded during a war between the Turks and the Venetians. Pheidias and his pupils executed the celebrated sculptures which decorated the upper portion of the temple. Their mutilated remains were rescued by the English and most of them are now safely housed in the British Museum. The collection forms an object of pilgrimage to art lovers from every civilized country, for the reliefs are universally acknowledged to be the supreme masterpieces of human genius that exist in marble. The culmination of the art of Pheidias has unfortunately perished. This was his colossal gold and ivory statue of Athene. It was 39 feet high and was renowned throughout the classical world, but we have only a few imperfect impressions on coins to give an idea of its majestic beauty. The Parthenon is considered to be the most perfect example of the Doric Order of Architecture, while the Erechtheium shows the fullest development of the Ionic. It was built shortly after the death of Perikles, and although mutilated is in better condition than the Parthenon. It is famous for its unique vestibule, whose entablature is supported by those six stately female figures so well known to all as the Karyatides.

The ruined Odeon stands at the base of the Akropolis. It was a roofed-in theater—an unusual kind—built in honor of his wife Regilla by Herodes Atticus, a wealthy philosopher of the time of Marcus Aurelius. Remains of the roof-beams were found not long ago. The characteristic round arches, clearly seen in the engraving, show the Roman origin of the building, for this feature was never used by the Greeks. STUDENT

Prehistoric Civilization in Ontario

IT is reported from Fort Frances, Ontario, that prehistoric relics have been discovered there, proving that at some time prior to the advent of the North American Indian, this district was inhabited by a race of people far advanced in the arts of civilization. Workmen engaged in clearing the channel of a diverted river, for the construction of a power dam, found a pot-hole containing weapons and articles of pure copper, arrow-heads, spear-heads, fish-hooks, rings, bands, tomahawks, and ornaments. These were skillfully and neatly fashioned, indicating great artistic ability; some of them had been hardened to a cutting edge, which shows that the art of tempering copper, (recently re-discovered by us, it is said) was known at that time. The story of ancient American civilizations, which is as yet but a future prospect, will surely be very interesting, and is calculated to give a new historical perspective. T.

The Trend of Twentieth Century Science

The Rebirth of Old Types

SOME recent studies in horse-breeding show how close to the surface, even if absolutely out of sight, may very remote and apparently extinct characteristics be lying. The studies of Ewart corroborated a case mentioned by Darwin. Some striped hybrids had resulted as the progeny of a mare and a quagga—an animal allied to the zebra. Three subsequent colts, *also* striped, had followed as progeny of the same mare and a horse. The influence of the former (quagga) parent remained active. Studies by Ewart of other similar cases, the first male parent being a zebra proper, have shown that the stripes of the later progeny were much more complex than those of the zebra, "indicating," says Professor Cook, "that a primitive character of some remote ancestor came into expression, instead of a character transmitted directly from the zebra."

We seem to get some light upon the origin of new human races, as here in America, from the crossing of old ones. If the analogy holds, the first effect—enduring for how long we do not know—would be hybrid blends of physical characteristics. After that, very ancient characteristics, long vanished and hidden, would come into view and the new race would be the re-appearance of some lost type or types. Everyone of us would contain the locked up results of forgotten civilizations.

STUDENT

The Other Science

BEHIND the various learned theories of the origin of myths and legends among all nations, theories it will some time be very interesting to recall historically, the popular mind seems to be arriving at conclusions of its own. The Sunday editorial page of a Chicago daily of wide circulation ventures upon this:

The actual discoveries of modern science disclose that the ancient myths are the fossilizations in the memories of our unscientific ancestors of a thoroughly matured system of science, vastly superior to any state of culture which now exists or has been known within the historical period. The myths consist of words, proverbs, symbols, pictorial and sculptured designs, legends, stories, epics, precepts, liturgies, and elaborate systems of doctrine which are foreign to the experience of men during the historical period and which cannot be supposed to have evolved from or to have been suggested by that experience.

The writer goes on to assert that the far prehistoric ancients knew matter from its spiritual side, its living side, as a congeries of living spiritual entities of all ranks; and that the myths and so on are the remains of a science dealing with the life-history of, and mode of dealing with, these beings.

Knowingly or unknowingly, he is on a corner of the Theosophic field. But the interest of the statements is the fact that a popular journal should give space to a lay editorial for their quiet unargued presentation to two or three hundred thousand readers.

The present science of mythology, thus ignored, may ultimately come to learn a lesson

from chemistry. For the latter, now building up "matter" from "non-matter," from the electrons or immaterial centers of force, is getting near the ancient point of view. When the center of force is seen from its other side as a center of elementary cosmic mind, in its way a being, the ancient conception will have been reached and the myths can be re-studied.

But there will have to be a good deal of translation. Suppose a man knew as affections of his own consciousness all that passed in his own body, knew physiology minutely on its subjective side. His attempts at description of what he felt and knew, whilst absolutely accurate scientific statement, would be unintelligible to the modern physiologist who deals with bits of the same knowledge from its objective or test-tube and galvanometer side.

The consciousness of very ancient humanity was much more occupied with the subjectivity of the world than its objectivity. It had not yet focussed its mental lens to the plane upon which ours is fixed. But it dealt with the same phenomena, and the science of the ultimate future will be a blend of the two knowledges to the profit of both, the inter-correction of both. If we need the ancient view, is also needs ours.

Our Bacterial Retinue

IT is pretty well agreed now that we have ourselves generated the bacteria to which we owe our diseases. The morbi-facient ones have arisen by mutation from innocent ones in correspondence with blood conditions that never should have obtained. The normal bacterium is at his proper work when he is disposing of dead stuff; living bodies should be self-protective against him. The blood failing in some direction of its full power of self-protection, the bacteria changed themselves a little so as to live in it in accordance with the lessened power of defense. This power lessening in *various* directions, various corresponding bacteria, producing various diseases, arose from the innocent ones. It as if a housewife should leave different sorts of food exposed in her pantry and as many different sorts of cockroach, each eating one of those foods, at once differentiated out from the common cockroach. The pantry might be said to be the victim of as many diseases.

Sudden changes of species, called by de Vries (when occurring among the higher plants) "mutations," are very common among the bacteria and easy to produce. We should say that bacteria are very plastic were it not that these species having once suddenly appeared, are quite stable and permanent. They are produced by altering the food medium in which they live. Some ordinary bacterium is allowed to multiply in a food medium containing among other things an ingredient they do not usually touch—milk sugar. The multiplication is very rapid, says Dr. Müller in *Umschau*:

each individual dividing into two in less than an hour and in the course of twenty-four hours producing millions. Hence their usual food, if not

very abundant, is soon exhausted. In this juncture it appears as if one of the bacteria suddenly discovered the nutritive properties of the hitherto untouched milk-sugar. This inspired bacterium multiplies more rapidly than the rest, transmitting the new character to all its descendants, which retain it during years of subsequent culture on media that are not furnished with the sugar.

The bacterium is of course a cell, and Dr. Müller suggests that we have here a little possible light on the development of cancer:

In both cases some members of an ageing congregation of similar cells suddenly burst through the bounds that have hitherto limited their capacity for reproduction.

To the biologist, he adds, the phenomenon is extremely significant, for it implies the (ordinarily denied) possibility of the transmission of acquired characteristics. Weismann's experiment, that of cutting off the tails of many successive generations of mice (finding that the last generation had tails of the same length as the first) proves nothing, for whilst the mice had nothing to do with the mutilation, except to suffer it, the bacteria *effected their own change*.

If a man, standing in the center of his being, were suddenly to will his body into the possession of the full technique of a pianist, his "mutation" would probably be transmitted to his children. The usual years of practice are somewhat like Weismann's procedure upside-down, something being (almost artificially) added on as it were from without. Man may come perhaps by the other power later on.

STUDENT

The Atmospheric Skins

THE balloons have now clearly differentiated three of the—how many?—layers of the atmosphere; a fourth, which might be provisionally called that of speculation, will hardly be balloonable.

The lowest and densest of the three is about 10,000 feet thick. Its winds are irregular; the temperature, though on the whole decreasing, does so irregularly, and there are temporary foci and layers of increase.

Through the next layer, extending up to a height of 30,000 feet, the decrease of temperature, still continuing, becomes gradually regular; the irregular winds are no longer found; says *La Revue Scientifique*:

in the end the movements of the atmosphere, according to the laws of the general circulation, prevail, while the velocity of the currents grows greater and greater.

Warm air rises through this layer from the earth's surface in a great stream, swiftest of course from the hot regions about the equator, gradually losing its heat as it rises; then sweeping spirally and very swiftly towards the poles.

The third layer is almost still, floating upon the second. The fall of temperature ceases, a rise replacing it, whilst the air is here quite dry. To account for this remarkable rise of temperature a fourth layer has been suggested, one in which atoms, probably of hydrogen, are disintegrating and liberating their energy, part of it appearing as heat.

The Persecution of a Color

WHO has not felt the flash of stimulation from the radiant golden light which streams from yellow flowers exposed to the strong sunshine? The walls of Whistler's rooms were colored lemon-yellow, as he said it was the only way to bring the sunshine into London houses. Wordsworth has sung the thrill, the pleasure, and the dancing of the heart produced by the mere memory of "a host of golden daffodils." Try the addition of a handful of the evening primrose or the *coreopsis* in a bunch of flowers which have been grouped in disregard of color harmony. The warring colors are immediately reduced to perfect peace and brotherly agreement. The power of yellow to attune discordant colors is a fact well known to painters who so frequently surround their pictures with a *gilded* frame. An English oculist some twenty years ago began prescribing yellow spectacles for certain eye complaints and recommended yellow writing-paper in the place of ordinary white stationery.

But ever since the rise of Christianity an effort has been made to bring the color of the buttercup into contempt. Painters have represented Judas in a robe of yellow. The persecuted Jews could never venture forth abroad without their saffron-colored garments, and in Spain the victims of the Holy Office, and the wretches doomed to death under the civil law, were led away to execution wrapped in yellow. Then somebody first launched the foolish phrase "a yellow streak" to signify an ugly trait in a man's character; whereas it naturally suggests a vein of gold, its very opposite. Why also is the lowest form of journalism christened "yellow"?

Has this relentless persecution of the most glorious of the seven sisters of the spectrum been the work of those who hate the golden sunshine and who come not to the light "lest their deeds should be reproved"? Has the attack been set on foot by those who, in unconscious correspondence with eternal fitness, clothe themselves in black, the color of obscurity, of darkness, and of night? STUDENT

The World Drying up

HERE is another scientific scare. The *English Mechanic* says:

Europe is drying up! M. Martel casually said so a year or two ago in a lecture on some other subject, and that unless something were done, a large part of the world would, in a few hundred years, die of thirst. Herr Walser has now, in a sense, measured the rate of dessication, and has actually proved that hundreds of European lakes have entirely disappeared, and a large number shrunk almost to vanishing point. In the Canton of Zurich alone, where in 1660 existed 149 lakes, Herr Walser can now lay his hands on only 76, and barely half of this residue remain undiminished in size. Much the same tale is also told of German

and Russian lakes, and similar instances of progressive aridity are seen in Western Asia.

"Unless something is done," says M. Martel; and one wonders what could be done in such a case. Perhaps Herr Walser had better be commissioned to "lay his hands" on all the lakes that are still left, whether German, Russian, or of what nationality, before any more of them disappear. There seems no doubt that fertility passes in waves over the earth. Parts of Asia have been dessicating for a longer time than Europe. But there seems no danger of the whole earth being dessicated at once. If the march of empire takes its way westward, perhaps the areas of fertility accompany it. Are not the sites of the mighty empires of the past buried under desert sand? And shall Europe escape a similar fate? But doubtless there will be time to move; and the westward march leads round to the eastern lands again. Perhaps there may be lands still further east than Asia and therefore the sites of a still older civilization. T.

The Sense of Direction in Animals

A FRENCH scientist has been testing the directive sense in bees, which can fly for two miles from their hive and then return with honey. He proved that neither vision nor smell helped them. When removed in a closed box they would still return direct; and this even when blindfolded. Other experiments showed that bees cannot smell far; besides, they still returned after the organs of smell (antennae) had been removed.

Since other animals besides bees exhibit this power, there is no doubt that it exists. Human beings have it, but do not trust in it and allow their mind to interfere. As to explanation: perhaps when we can explain our other senses we shall be able to explain this. How can

we see across two miles? The ether, you will reply. But what is the ether? And about smelling? Then again, distance does not really count; because, *without a bridge* it is as far from one molecule to the next as it is from here to the sun. H.

Snake Milks Cow

A PRESS report says that a certain farmer in Illinois had a Jersey cow which did not give her usual supply of milk. His boys watched, and were surprised to see a snake glide through the grass, raise itself, and proceed to milk the full udder of the cow. The snake being killed, the cow thereafter gave her usual supply. T.

A Solar Condensing Plant

A CHEAP and effective condensing plant, in which the sun's heat is made use of, is employed in the great Chilean desert. There is a great deal of brackish water, quite unfit for either man or beast. But a series of frames containing many sheets of glass are erected over the water. The sun's rays evaporate the water and it condenses upon the glass and runs down into pans and thence into a main reservoir which collects thousands of gallons of pure water daily. T.

Chamber Echoes

M. GUSTAVE LYON has been carefully studying the why of the acoustic misdeeds of public halls and has found a very successful method of remedying them. The first thing was to discover the main points of echo, not very difficult to do, but for which he has an ingenious device of his own. These are then covered with a double layer of cloth, the layers being a few inches apart, separated by air. The two layers are necessary, one being of little effect. C.

The Legend of the Leek

A TALE OF SAINT DAVID OF WALES

I DREAMED of Dewi, Sandde's son,
Whose pure, un-Roman crozier swayed
Dimetia from the wattled shade
Of green Pebydiog; and thence won
Headship of all the Cymric choirs:
A man whose gentle luminous eyes,
Great with a thousand depths and fires,
And made with deeds and sorrows wise,
And blinded naught with hopes and fears,
Had pierced the meanings of the years.
I saw no meanness while I dreamed,
No little man as men are now;
But such a kingly soul he seemed
As one upon whose royal brow
A star to guide mankind is set;
One of a race of men whose birth
A thousand years may not forget;
Who come but once an age to earth,
And fill a million hearts with mirth,
And melt a million eyes in woe,
And blow the smouldering fires of hope
To whirling flame before they go,
And forge men brands wherewith to cope
With all the dragon powers of night,
And win new realms from Annwn's deeps,
And fill dark hells with radiant light,
Breaking the battlements and keeps
Of many a demon-haunted hold
Upreamed upon the margin cold
Of the old, moaning tides of hell.

I dreamed one came to David's cell
Three days before his death should be;
And, "Must thou die indeed?" said he;
And, "Yea," the old man said; "but see,
This death is but the laying down
Of an old, out-worn, faded gown,
To don a newer garb anon."
"But ah," the young disciple cried,
"What shall we do when thou art gone?
Are not our sorrows deep and wide?
The twilight of our day is here,
And gray clouds cover all the sky,
And darkly wailing winds and drear
Shrill from the mountains. Why, ah why
Art thou to leave thy Cymry now?"
And David answered, "Peace my son!
Dost thou forget, 'Thy will be done?'"
Then the youth said, "But in the years
Of our dark sorrow yet unborn,
Shall we remember, through our tears,
Our star and hope; or all outworn
Shall we go voiceless down to night,
Dim-eyed and wailing, worn away,
Ere time's new dawn of day is bright,
By titan passions to have play—
Fierce hates and battle-lusts—before
Our last gray day-gleams shall have paled?
Shall we at last be great once more,
Or shall God write—'They strove and failed;
Let them make way for other hosts
And stronger peoples, for Mine earth
I will not cumber with the ghosts
Of ancient races that had birth
In the world's young time: let them die?'"

I dreamed there was a tear in David's eye
Which as the young man ended, fell; and then,
Slowly, "What wouldst thou have, my son?" he
said;
"Toil thou, and ever hope and toil, that men,
Being not many souls, but one, be led
To hope and labor; so that whatso night
May darken, they shall not forget the sun
Whereby a thousand lands are filled with light
That is, as men in truth are, only one."

"That which my hands may do, or my hope span
Shall not be left uncared for; yet some sign,
Either a star of all God's hosts a-shine,
Or else some jewel, greatly prized by man,
Which should be graven and blazoned and deep set
On all her ensigns in the after-days,
Choose thou for Gwalia, lest her sons forget
Thy message and thy wisdom; and the ways
They follow end in bleakness." "Then go thou
And pluck some live thing from the garden now."

And he went forth, and came where roses grew;
Redder than aught that blooms beneath the blue
Those rich, red roses bloomed; deep, passionate,
Full of the lure that makes men love and hate;
Full of the rich, dark pride and langorous mien
Only a red rose or an eastern queen
Wears; and their beauty bowed his spirit down.
"Surely 'tis thou shalt bloom in Gwalia's crown,
Thou Darling of the World and flawless gem
In Beauty's high, phantasmal diadem;
Thee will I choose," he said.

When David saw,
"Nay!" he made answer; "wealth and ease no
more
Are for the Cymry: empire hath gone by,
And, ere it come again, dim years shall die;
Dim gray-winged years, slow-fluttering toward their
peace
Where in the waste all waning ages cease:
This rose is not the flower."

Again he came,
Crossing by lawns with daffodils aflame,
To a deep-bordered place of sun and shade
Where, peerless 'mid a thousand blooms arrayed,
Lifting aloof her whiteness 'gainst the noon,
Whiter than white clouds on the blue of June
A lily bloomed: round her were pansies deep,
And crimson, opulent peonies, heavy with sleep;
And martial tulips sentined her plot,
Set in blue dimness of forget-me-not;
And wall-flowers swung her incense, and sweet-
briar.

And when he saw her bloom, his soul caught fire
With worship of her lone and smirchless grace:
"Men shall remember, when they see thy face,
The stainless soul of him that is to die,
And all his wisdom; they shall not dare lie,
Nor suffer meager-heartedness to mar
Their large and perfect living. For his sake
And for thy whiteness thou shalt shine our star
And high remembrancer and sign, to wake
Pure memories, and conserve our inward peace,
Lest the Light David loved and lived for cease."
So lit with dreams he came to David.

Then,
"Nay, son!" the old man said, "go forth again;
Thou hast not chosen the flower. Ye shall not dwell
Aloof and stainless from the moil of things;
But rather spend yourselves in wars on hell,
And at the last, perchance go down like kings,
Much wounded, battle-burdened, unashamed.
No star of all God's armament hath flamed,
Nor shall, before your eyes, to call ye forth
And seal ye safe from buffetings, and maintain
Your whiteness unassailed and void of stain,
And unparticipant in this troublous earth;
Bring thou the humblest green thing in the field."

He left him without speech, and hurried through
The garden that all beauty's blooms did yield,
Naught heeding them, and went beyond, and drew
Out of the ground a leek, and light of pace,
Came back to David singing.

David's face
Lit when he saw him come, and, "Son," he cried,
"Now hast thou chosen rightly, freed from pride.
Neither thy rose my people's sign shall be,
Nor thy white lily; though these gifts were well,
And not all unavailing. Who can tell
What depth is in the rose's heart, or see
What peaks the lily pointeth? God's own hand
Hath set eternal beauty in this land
To fill an endless line of bards with song,
Beauty's deep rose, for which all hearts shall long.
Well didst thou bring the rose. And in my race
The haters of the world shall have no place:
Even in her darkest day, her sorrowful hour,
No priesthood in White Wales shall wield the power
Of demon magic to hold souls in chains.
E'en when the world's white light of wisdom wanes,
And empire by proud empire is bowed down
Before hell's dark-robed ministrants, whose frown
Shall blind and blight man's proper manhood—these

Shall little thrive 'twixt Hafren and the seas;
Well didst thou bring the lily.

But this green,
Poor herb, wherein no vision grace hath seen,
This pale-leaved, silver-rooted, vauntless thing
Shall be your sign, whereby your thoughts shall
wing

Far to your peace. Green leaves to give you dreams
Of the old, green Mother, and her hills and streams;
That though in gray, dark towns cooped night and
day,

The winds that pass the woodland elves at play
Out on the mountains, through your minds may
blow,

Whispering strange old secrets as they go.
That the enchantment of the green wave's roar
May fill your hearts from the long-distant shore,
And all wild mysteries be with you still
Till the old weary earth hath had her fill
Of blind and faithless woe.

Yet cut away
These same long leaves I give you, from the pure
And foam-white root I give you, and a day
Shall see them fade. Nor shall my land endure
Except ye hold in mind that as these green
Leek-leaves are made, by that which groweth unseen,
One growth, one being, so men too are one,
Yea, leaves whose Root is Very God, and so
Bound in one Brotherhood." Thus speaking, lo
The strong voice ended, and the dream was gone.

Build on Resolve not on Regret

WHAT are we aiming at? Is it the evolution of self-reliance—or doubting incapacity? To be helpers—or helpless? If the former then must we take up the weapon of the courageous warrior and *resolve* to fight, *resolve* to be "a hero in the strife," letting the "dumb driven cattle" attitude be an incident of the past. Have we not here before us in these words "Build on *Resolve*, not on *Regret*" the picture on the one hand, of a positive, and on the other, of a negative life—of progress, and retardation? Are they not the opposites leading to strength or weakness?

W. Q. Judge once said that it was a weakness of human nature to regret a mistake or failing, and he drew our attention to the soul stirring teaching—fit food for warriors—"Never regret, never be sorry, and cut all doubts with the sword of spiritual knowledge." Does this teach callousness? No; but it teaches economy, in the Râja Yoga sense of making the best use of our energies.

Have we not, most of us, experienced a certain false satisfaction and salve that in regret we feel very sorry? But what real value is it? Do we not go and do the same thing again next time? If we ask why, was it not because we took up a negative, dissipating attitude, and centered our attention on the past?

The forward step is resolve, to look the lower nature squarely in the face, own up to one's self it was wrong, and resolve to try again to affirm one's Divinity in action.

It is interesting to trace these two words to their source. Regret we find to be derived from two Latin words meaning "to step back," while the derivation of Resolve leads us back to the Latin *Solvere*, "to loose, to untie, to unbind." We must build our present lives on the firm foundation of Resolve, that we may take a more unselfish share in helping forward the work of Universal Brotherhood. E. I. W.

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question I often hear it said that men come into the world, and leave it, by no will of their own, and the latter part of this statement at any rate, appears to be true. What does Theosophy teach on the subject?

Answer Mainly, perhaps, that we have a misguided notion of the word *Will*, and force it to serve in places beneath its dignity. You lose your temper suddenly, and make some pronouncement that you regret afterwards: "It is my *will*" that such and such should happen. But was it your will at all—or the will of the passion that had hold of you then? How far will you allow that it represented yourself?

The value of one day in a man's life is not to be gaged by any single moment in it, but by the general trend of thought running through it all. True, some moments do count for almost everything by reason of their intensity and influence on the others; and all moments count for much; but that behind the moments, which inspired or degraded them, makes the general worth and resultant of the day. One may have made no conscious resolve to do so, and yet manifested himself in a series of sunny actions and feelings, which will have more to do with the day's output of will, than his resolve to go to business by an unusual train that morning, or to dine at an unaccustomed restaurant. Not that even these things do not spring from the same source, or are not to be accounted for in the same manner; but they give little or no clue to the day's will-play, whereas the main current of the moods do reveal it almost completely.

We dwell down in moment after moment as if they were valleys; and little events are our boundaries and mountains that hide the world; unless we ascend, and stand at the peak of these, we can get no view or knowledge of our kingdom.

We are not commonly at all conscious of the will, and hardly know that there is such a thing in us. Many a man passes for strong-willed, because he blusters and will never forgo the desires of his personality, who is found at last to be very flaccid and negative, and can oppose no fortitude to misfortune. He has made a reputation for strength out of his very weakness, and carries his fellows with him by the noise and bravado of his demeanor. He has strength for nothing but to resent opposition; whoever opposes *him* must be cast down and made miserable. But the man of real will-power treats opposition differently, and uses it for confirming his own soul.

So will is quite unlike the thing we commonly suppose it to be; whether one considers it in its excellence, as the property and engine of rare souls; or in a lower aspect, as the director of our lives and common heritage of us all. It is a thing behind the scenes, rarest manifesting itself in apparent and obvious flashes; look for it in the silence rather, in solitude and moments of temptation and adversity. It is less that by which one man triumphs over another, than that by which he triumphs over himself. The richest will is his who is both self-mastered and compassionate; for compassion is the will universal, the brightest weapon in the soul's armory for the service of the world. Such a man is like a general

dominant in a conquered country; he marches where he will, and no man sayeth him nay. The will of him who is only self-mastered is poorer; he is like one besieged; capable of resistance, but of no far action or initiative. The poor will is his who is indifferent and purposeless; he is conquered and downtrodden in his own land, and a prey to all the banditti of passion.

So it is not the volition of this moment or that, which must be called our will; but the marshall of all our desires and aspirations. A man may wish for a long life, and be determined ever so firmly to exceed a century of years; that will not decide the day and moment of his death. Since his birth he has been using his body; every day he has weakened it or made it strong. No thought of him but has laid its impress on the flesh; and no thought of him but has had its sanction from his firm or feeble will. Consider how the atoms come and go, and what attracts them, and what they gain during their sojourn with us.

Evil is not evil on one plane of life only, but on all; custom does not make right of wrong, and old morality has this confirmation, that he who offends it layeth the axe unto his own root. Perfect health is consistent with nothing but perfect calm and clarity of the mind, and perfect generosity of the soul; that which we call moral evil—all the seven, and seventy times seven sins—is also the sure undermining and destruction of our physical life. If a man had lived dispassionately, he would have set no cause in motion, at least in this life, to prevent his well exceeding the three score years and ten. If he had lived compassionately also, he would have drawn to himself the best material in the world; one would not then set limits to his possible longevity. I doubt that we die of old age often, but rather of some disease which we prepared for ourselves in the moments of our passion and weakness. What a grand stream of life we squander in loose chatter and idle thought.

Again, there are other factors to be taken account of. We did not begin to be at birth, and have not the whole arrangement of our present fortunes in our present hands. All that we did in the multitudinous pasts is to be considered. The frame on which our bodies grew was not determined in the present age; nor was our character, nor the power we have to resist temptation. Yet did we make them for ourselves; and will works towards life or death through all these things.

One might put the whole matter in this way: if you are a glutton, you are taking more poison than nourishment with what is eaten; which poison is to work through your system, and break it up in its own time. If you are a glutton, that physical fault is the fruitage of a mental one, which is the fruit of a wrong direction of the will. Your will determined your thought, your thought your action; action took its own time to debase and thoroughly vitiate your body, and then came death. How can one rightly say then, that he leaves the world "by no will of his own"?

The next thing to be discovered, or far from the next thing, will be man. There are more unknown regions within him, than all the geographers have ever mapped. Yet there is an atlas of man, by name Theosophy, wherein all his seas and shoals are charted, and all his

continents carefully drawn. Would he but learn from it—would he but learn from it!
STUDENT

Answer II. All this is perfectly true from one standpoint, viz. that men do come into the world and leave it by no will of their own. And fortunate it is that this is so—fortunate that there is an overruling will, and that Nature's purposes will not be thwarted.

The very fact that man finds his personal will overruled, set aside, should—it would seem—cause him to reflect that there is a greater power in the Universe than himself. It is quite true that you, as you think yourself to be, did not ask to be born. The thing is absurd, for you did not exist as *you* until you were born, in fact not until many years after. Perhaps even, indeed almost certainly, if you are still on the younger side of middle life, you are not that which you fully may be and can be. And who knows but that there may still develop something in your nature which will give you a key to the knowledge of life, of birth and death that will make such a statement as this absolutely unnecessary.

It would seem that if anyone makes such a statement as this, the wisest course would be to assent to its truth immediately. But not to leave the matter there, for there is much more to be said. The sun rises and sets, the earth is stationary, we say. And the statement is true from our habitual plane of sense perception. It was not by our will that we were born, nor by it shall we die. Equally true and equally false.

We need a broader outlook, too long did the people regard this earth as the center of the Universe; and too long has man centered his consciousness in the personality and circumscribed it by his personal desires.

There is a sun in the heavens which is the center of our solar system and it in turn revolves about a more glorious center in a vaster orbit. There is a glorious spiritual sun in our own lives, a royal Self, the Higher Ego, the Spiritual Soul, our very Self, from which the consciousness that we think to be "I" is but a pale reflection.

This royal Self never was born, and never will die. "It is even a portion of myself which, having assumed life in this world of conditioned existence, draweth together the five senses and the mind in order that it may obtain a body and may leave it again."

Once we knew ourselves for what we really are, but in the task that is ours of lifting up the whole matter of the earth and all the creatures thereon to a higher plane and in the necessity of becoming clothed with garments of flesh, we have lost sight of our divine origin and nature, and we have had to wander for many weary ages in spiritual darkness.

From one standpoint it is a wholesome sign that men and women are beginning to question the impassive Sphinx of Destiny. There is something stirring in their hearts that demands that they shall seek an answer to the problems of life. But just as true is it that the answer cannot be gained without seeking, earnest seeking, that will not be turned aside. The Sphinx is silent, it would seem in vain to question her, her eyes look too far off to the distant horizons; but her very silence is an answer that the solution of the riddle lies in the depths of your own heart. THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l O f f i c e P o i n t L o m a C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

The Churches

The Church Clings to the Authorized Version

THE Episcopal General Convention, at Richmond, decided by a large majority against the use of the Revised Version of the Bible, and adopted a formal declaration that the King James or Authorized Version is the standard Bible.

The King James Version is only one out of many, and even that has been more or less arbitrarily altered from time to time since its original production. In its present form it is admitted to contain many mistakes. The Revisers, a competent body, from the orthodox point of view, if ever there were one, have pointed out passages in which words have been put into Jesus's mouth by theologians or scribes at some unknown epoch.

But, as a writer says:

The reason is almost wholly sentimental. The very sacredness of the Bible, in the minds of those who read it, makes any change in the wording of familiar passages an unwelcome innovation.

It is true that many have this sentiment; it is also true that it saves people from having no sentiment at all; which might be worse for them. People sometimes use crutches, spectacles, and bandages. Whether or not to take these things away, is a question that cannot be answered categorically.

Upon what is this sentiment for the Biblical letter founded? Upon the fact that it is a sacred memory of childhood. Grown people who have not been taught the Bible in their childhood have none of this sentiment. It is as well to know just how deep and how shallow this reverence is.

If we take away a man's crutch or his feeding-bottle, it may be better for him—or not. It depends on the man and on other circumstances.

It is as well to know that not a few of the phrases so dear and holy to many, were put there by men far less conscientious than those modern Revisers to whose handling people object. It is as well to reflect that if we bring up our children on the Revised Version, they will grow up as endeared to it as we are to the old, and the Authorized Version will seem to them like profanation. And let us not deceive ourselves with the delusion that it is the literary style that pleases us; if we are such connoisseurs, we can gratify our fine palate on other specimens of choice archaic English.

MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed: it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

Yes, it is not in the matter of Biblical predilections alone that we are such slaves to usage. Our most cherished convictions, prejudices, and ideas are often traceable to some childish episode or picture-book; he who has ransacked the lumber-room of memory knows that well enough.

The Authorized Version is, in fact, for those who have been brought up on it, a means of arousing a certain desired state of mind. In common with the church furniture, the priestly vestments, and other associations, it is part of an incantation. The essential feature is that it should be familiar. The kind matters not; I could not feel religious in your church; you could not worship with my Bible; such at least is the sectarian feeling.

But the attitude of a Theosophist is not that of a flippant heartless ruffian who would take away a poor man's food. It is that of a helper and teacher who would wean an overgrown child from his feeding-bottle, or an invalid from his self-indulgence. Theosophy does not ask the Bible-lover to step out into an atmosphere of ribald scepticism or a chill region of theologic doubt. It upholds reverence, but offers it a worthier object. It says, Be *more* reverent; waste not your spirit on mere personal predilections.

It may be a wrench to break away from old predilections; but everyone in this life has to face wrenches. Death steals away our loved ones, without regarding our feelings. There may be a sterner voice in the heart that may overrule sentiment. Perhaps there is in our clinging an element of weakness which the Soul demands that we shall get rid of. Perhaps we are being taught to understand that no man can carry with him through eternity his cherished belongings, unless indeed they are of the kind that moth does not destroy nor rust corrupt.

This clinging to the text of a particular edition of a particular scripture is a weakness; let those who will, cherish it; but they may find that weakness incompatible with other

things which their Soul desires.

Beneath the dead-letter of the Bible there are truths far more worthy of reverence than the dead-letter interpretation. For it is not mere folk-lore, but a sacred allegory. There are veils to be seen through, and wisdom demands effort; we cannot have true religion delivered at our door with the milk, nor grace

administered with a spoon.

Bible not Original

A TRUTH needs to be repeated a great many times before it sinks into the general consciousness. A professor of the faculty of the divinity department of the University of Chicago, says that the Bible is not original with its supposed compilers, but that the stories of the creation and the deluge appeared long before the Bible was written, being traditional in the early literature of the Babylonians. This is, of course, known to well-read men. Theologians of today, he added, are acquainted, as those of former days were not, with the reality and vitality of non-Christian religion. There are elements in every pagan religion which every Christian is compelled to recognize as truth.

The said creation and flood stories, of course, are no more peculiar to or original with the Babylonians than with the Bible. For how are we to account for the creation and flood stories of the American tribes? They are the relics of symbolic records referring to past stages in the evolution of the world and its inhabitants, to past ages of history, and to the drama of the Soul. Rightly interpreted—that is, by the light of a general study of the ancient Secret Doctrine—they are mines of wisdom; but taken literally they are both absurd and self-contradictory.

The position of these outspoken divinity professors is peculiar; they are utilizing the altitude at which they sit as a means whereby to saw off the bough. For surely divinity (*in the Occident*) means the Christian religion; and what becomes of the Christian religion if we admit the truth of pagan religions? Can the faculty of divinity gradually be converted into a faculty of universal religion? Let us hope so!

The Sanctuary of the Spirit

A ROMANIST, writing in the *American Magazine*, on the religious question, says that people do not go to the Protestant churches because

THE THEOSOPHICAL ADDRESS AT ISIS THEATER

Prof. C. J. Ryan speaks on "The Bible—
A Chapter in the Wisdom-Religion of the Ages"
LAST evening at Isis Theater Prof. C. J. Ryan's address on "The Bible: a Chapter in the Wisdom-Religion of the Ages," was listened to with the closest attention and interest, and the music program by the Rāja Yoga quintet gave great pleasure. The following is from Professor Ryan's address:

"In this paper it will be my endeavor to give an idea why students of Theosophy regard the Bible as one of the many presentations of the ancient Wisdom-Religion which have been brought forward from time to time in forms suited to the minds for whom they were written.

"If we pick up almost any high-class magazine we shall be likely to find passages such as the following, which is from a leading review. Speaking of the extraordinary revelation of spiritual unrest and hunger shown in the letters of nine thousand correspondents to a great newspaper, the writer says:

"The position of the clergy becomes difficult; they are still bound to profess and preach what the people can no longer accept. Ingenuity, compromise and evasion—all well-meaning enough—are rampant. On the one side is a creed which demands drastic re-statement; on the other a new culture and a new earnestness, everywhere waiting to be molded and consecrated. The church of the future, it would seem, must be a church of human hope and corporate effort based on the character of Christ and the intellect of man."

"Such a church would be a Theosophical one if, at the same time, it had a knowledge of the inner meaning of the doctrines which it would put forth in simple forms. The desperate effort to preserve the creeds and dogmas in the absence of this knowledge is resulting in an ominous and rapid decrease of candidates for the ministry. The preachers who still possess influence are principally those who are devoting their main energies to social service, rescue work and such practical matters. These are significant signs and render it obvious to the Theosophist that in proudly separating itself from all other world-faiths, western theology has weakened its power of carrying out its greater object. It has forgotten that the Bible is only one of the vehicles of the ancient Wisdom-Religion, now called Theosophy, and that Christianity is nothing new. I say forgotten, because it knew it once, to judge by these words of St. Augustine:

"The thing which is now called the Christian religion really was known to the ancients, nor was it wanting at any time from the beginning of the human race until the time when Christ came in the flesh, from whence the true religion, which had previously existed, began to be called Christian, and this in our days is the Christian religion, not as having been wanting in former times, but as having in later times received that name." (*Retractions*, I, 13)

"H. P. Blavatsky says in the opening chapter of *The Secret Doctrine*:

"In this age of crass and illogical materialism, the Esoteric Philosophy alone is calculated to withstand the repeated attacks on all and everything man holds most dear and sacred in his inner spiritual life. Esoteric philosophy reconciles all religions, strips every one of its outward human garments, and shows the root of each to be identical with that of every other great religion."

"Time will, necessarily, be required before those whose minds are attached rather to the outer form than to the inner spiritual meaning can break down their personal feeling or pride in thinking they possess the only true faith; but if it be true that our race is the leader of the world in material and intellectual progress, what a splendid opportunity we have to do a greater work, to lead the nations to a real understanding of the Brotherhood of religions, a Brotherhood in which each would keep its place in the harmony as the most suitable vehicle for its own adherents and yet in which each would acknowledge the good points of the others, admitting that all were roads to the Truth which is greater than all forms. That is what is meant by the motto of the Theosophical Society, 'There is no Religion Higher than Truth.'"—San Diego Union

The Churches

(CONCLUDED FROM PAGE 10)

the churches have ceased to teach religion with authority; and because Christendom, outside the Latin Church, has ceased to believe in the fundamental truths of religion. And throughout his letter he speaks of religion and Christianity as if the two were synonymous! and without a hint that any opinion to the contrary could possibly exist. The obvious question: Why do not these people go to the Roman churches? he does not attempt to answer. Probably they are convinced that what is taught there does not constitute the "fundamental truths of religion" any more than what is taught in the Protestant churches.

His remark that "There is no hell to fear—why should people go to church?" seems to indicate that in his opinion, one of the fundamental truths of religion consists in terrorizing people into obedience by means of a hell; while his observation that many Protestants do not believe in original sin implies that that valuable doctrine is also one of the fundamental truths.

But let us see what one of such people has to say on the question. The quotation is from "An American Woman," in another number of the same magazine:

Man . . . has learned to think for himself in every department of life. He will not have his political convictions settled for him. He will not have his religious convictions doled out to him. He has learned that religion is an individual thing—secret and sacred between him and his God. He has learned that religion is born and waxes strong, independent of churches and without benefit of clergy. He has learned that he needs no church in which to set up an altar to his God—that sanctuary lies in his own heart.

That is why he does not go to the churches, whether Protestant or Roman. Feeling within his own being the sacred light of the Divine Breath which dwells therein, he defies the whole world to shake him from his stand. One of a nation that was born in freedom, he simply will not have his God born intellect fettered and cramped by dogmas. He will laugh in the face of anyone who shall tell him that the teachings of the Roman Church are the last word of knowledge which it is possible for man to attain. Yes, there is one thing that dogmatism will never be able to bind or kill, and that is the eternal free Spirit in the human breast, man's confidence in his own manhood, his knowledge of his own innate divinity.

STUDENT

The Gaelic Language Movement---III

A DOMINANT feature in the recent Oireachtais was the production of a new Irish music-drama, *Eithne*. The following is from an article on the subject which appeared in a Dublin newspaper:

Those who know the exhausting labors of the principals and the choirs-folk most of whom hurried every evening from a hard day's work to the still harder night's work of rehearsal—might well feel a certain anxiety. But the first act had not proceeded very far when this anxiety was dissipated. The great fact stood forth that *Eithne* was an arresting and significant creation. And given an artistic creation that as a whole makes a striking appeal to the mind, it does not matter very much what the curious or the formalistic think about the materials, and how exactly, as they think, the magic is made up. The magic itself is the main thing, and the artist himself cannot say whence it arose and how it arrived.

The interest is human, the atmosphere heroic at

the outset. Swiftly at the choosing of the *tanist* of the King of Eirinn the story unfolds itself. Ceart, the popular favorite, is unjustly accused of slaying the king's hound, and we see the designs of the brothers Art and Neart, children of a second marriage. The intervention of Nuala, mysterious foster-mother of Ceart, quickens and elevates the interest. With the philosophy of a song she sings, in which the king hears the voice of the god Aonghus Og, the drama is lifted to a new and subtle plane.

In the first scene of the second act come enchantment, beauty, and mystery, while events duly move towards climax in the second scene, and to completion in the third. It is all too delicate, too symbolical at stages, for fair or fitting summary. Eithne, the maiden of Tir na nOg (the divine world of eternal youth) waiting for the fit and destined hero (Ceart); her banished queen-mother, who proves to be Nuala, Ceart's guardian in the normal world; the way in which Ceart at once conquers and befriends the father—through the restoration of Nuala—but has yet to win the daughter, are among the things and phases that will bear a good deal of thinking over. The audience is offered a fair share of philosophy and symbolism along with the dramatic and beautiful music.

Some who looked very gratified, tried to insist all the same that the music was not "Irish" and "traditional," though it was palpable that none but an Irishman, steeped as it were in Irish music, could have composed a great deal of it. It is the regulation thing for our friends to say. If they did not say it they would feel that they had failed in their duty. "These thoughts and ideas are interesting, but they are a foreign importation. That is not the standpoint of the Gael." And so on.

Of course nobody now living has more than a fragmentary knowledge of what the Gaels and others practised and achieved in dancing, music, literature, etc. The competent Gael among us cannot safely generalize on the matter. Modern discoveries as to the antiquity and complexity of the civilizations of the past leave candid students humble and wondering.

Which brings us directly to the subject of these articles. What is the import of this strong move forward (not backward) into the realm of Celtic thought, language, and inspiration—so strong that there are already martyrs to the cause? It is not well to formulate, externalize, and objectivize the answer to such a question. The world has suffered too much from the dwarfing of history, and the euhemerization and anthropomorphizing of great verities, to allow the answers to such questions to be given in phrases which would necessarily suggest but the reflection of current ideas on the meanings of the words used.

Hence it seems better to give some glimpses of the past which may help the intuition of men to the answers; glimpses from the writings and records of those who do know whereof they speak, and which are, or soon will be, capable of verification.

In order to understand the growth and development of language one has first of all to enlarge enormously current ideas as to the antiquity of man. The reason this has been so long obscured, except for those who sought in the right way, is that in really ancient days the knowledge was confined to those who were initiated into the deeper mysteries of life. And as these were bound by solemn pledges of secrecy, it thus happened that those who knew, like Plato, for instance, were obliged to write in a veiled manner regarding many matters even of actual history.

It is not possible to understand the Irish traditions and the older archaeological remains without referring to the great Fourth Race of humanity. And this alone takes us at one bound, not to 3000 years ago, or 10,000, but, when it ended, to 850,000 years back. One

main stream of descent which converged in Northern Europe, and in which the language was largely agglutinative, came from certain Atlantean sub-races; the monosyllabic of the yellow, eastern, coming from some of the earlier Atlantean races; while the latest Atlantean and early Fifth (Aryan) were highly developed and inflexional, and Sanskrit became the first language proper of the early Fifth. The Arabic and Semitic were far later corruptions of the early tongue.

There are records which show Egyptian initiates journeying in a north-westerly direction, *by land*, via what became later the straits of Gibraltar; turning north and traveling through the future Phœnician settlements of Southern Gaul; then still further north until reaching Carnac (Morbihan) they turned to the west again, and arrived, *still traveling by land*, on the north-western promontory of the new continent or the British Isles, not yet detached from the main continent. They belonged to the *second sub-race* of the Aryan, and moved from one land to the other for the purpose of supervising the building of *menhirs* and *dolmens*, of colossal Zodiacs in stone, and places of sepulcher. (*The Secret Doctrine*, vol. II, p. 750)

This was "when the pyramids of Egypt and the palaces of Uxmal and Palenque were not in existence." Let geologists say how long ago this was, for they know Europe is comparatively modern, geologically speaking. But not all of it. If those Initiates erected the structures in Brittany and at Stonehenge some hundreds of thousands of years ago (long before the time of the Druids), it is highly probable that they did no more than *re-arrange* the stones at Brugh-na-Boinne, Ireland, even if they did erect some of the menhirs and dolmens elsewhere in that land. For a large part of Ireland, including Meath and the Boyne valley, formed part of the Atlantean system.

Now these stones, together with others used in forming what is now called "the tomb of Ollamh Fodlah," in Meath, are covered with markings similar to those on the trap boulders near the "city of Snakes" (Initiates), Nâg-pur, and elsewhere. They are written records of the oldest (Atlantean) races. They long ante-dated the Ogham writing, which in turn preceded the Runic. IRISH STUDENT

The Divining Rod

A CHRISTIAN clergyman describes, in the *Sarasavi Andaresa*, Colombo, his experiences and theories of the divining rod. He learned to use it while in the bush of Queensland, where a German friend, who was in the habit of locating wells for farmers, initiated him into the mysteries of the *Wünschelruthe* and he discovered that he also could use it. Any kind of green forked twig full of sap will do, he says; the forked branch ought to be 15 to 18 inches in length. If one is not a "medium," he should join hands with a person who is, each holding one branch of the twig in his free hand. Wherever there is water or treasure the twig will turn up. Gold, copper, and precious stones, will be indicated, but silver does not affect the rod.

The writer's theory is that the active agent is electricity. He takes the analogy of lightning striking the earth, which is due to the attraction of opposite kinds of electricity seeking to unite. And incidentally he brings out one or two interesting points in this connexion. Pointing out to a friend some trees which had been struck, he was answered: "Yes, because

there is water beneath them"; and the statement was verified by means of the rod. And he claims that it is dangerous to build a house over water for this reason; and that if a house is not built over water, lightning rods will probably be unnecessary. Further, people living over water are liable to disturbed dreams on account of the electric influences running through them from the air to the earth.

Few people nowadays are bold enough to deny the reality of the phenomena of the divining rod, which are far too well attested for denial. When we find business interests availing themselves of the power, we may be sure that it is not mythical. Hence the only hope of sceptics is to minimize the mystery as much as possible by trying to explain it away.

The objection to believing in the divining rod is of course that it contradicts our theories as to the possibilities of nature. But such theories cannot rightly be regarded as constituting more than a *presumption* in favor of the non-reality of an alleged phenomenon. If this presumption be over-ruled by evidence, we must conclude that our theory as to the possibilities of nature was wrong. The only thing that could possibly justify us in ruling out all the evidence as false would be the certainty that our knowledge as to nature's possibilities was complete—a certainty which no one can possibly have. Hence, the only reason which anyone can have for denying the phenomena of the divining rod in the face of evidence, or for trying to explain them away, is prejudice—the desire to believe that they are impossible. To this motive alone can we ascribe the fact that sane people should put forward such absurd denials and explanations.

It is evident that the power resides in the operator rather than in the rod; that some people have this power, others not; that among those who have it, some have it in greater, some in less degree; and that a person who has it can communicate it temporarily to one who has not. If we fail to find a satisfactory explanation of the workings of the power, it may help us to remember that we have no real explanation for even the commonest phenomena. If, for example, we try to explain how it is that we can move our arm, we can only say that the thought in our mind, coupled with the exercise of a mysterious power of volition, sets in motion some invisible fluid or agent, which in its turn sets in motion the physical mechanism of the arm. So our explanation is like a mathematical equation with several unknown quantities, and all we can do is to throw it into simpler form, the unknown quantities remaining as unknown as before. Any number of such explanations can be devised to account for the phenomena of divining. When these phenomena, together with allied ones, become more familiar, we shall doubtless devise some ether, some wave-motion, or some such ideal mechanism to serve as a formula for our ideas. The ancient explanation was that some nature-spirit actually came up out of the ground and tweaked the rod, and this explanation is surely not more difficult than others. Actions of all kinds must ultimately be traceable to *living beings endowed with mind and volition*, no matter how many material and dynamic links we may choose to put between the agent and the act. If we refuse to accept mind and will as our

hypostases, we are forced to devise in their stead substitutes which are different only in name, but in other respects are identical with the original mind and will. T. E.

The London-Rangoon Telegraph

THE telegraph line by which direct communication can be had between London and Rangoon, 7970 miles (says *The World's Work*), has cost eleven years of hard work; and a study of the countries it has to traverse will explain how that is. From London to Lowestoft, from Lowestoft to Emden, thence to Berlin and Warsaw, and so to Odessa, is comparatively simple work through civilized regions. But the Caucasus had to be traversed, where there were ravines and rivers to bridge, and great forests through which the line has to thread its way, keeping clear of the branches. Beyond Tiflis the line strikes southward over arid deserts (peopled by nomads) and barren mountains, to Tabriz; after which there are 381 more miles of desert to Teheran.

The maintenance of the line is not less difficult than its construction. Differences of climate play havoc with electrical adjustments, storms destroy, and ignorant nomads damage. In the section Rowno-Odessa a severe form of hoar frost collects on the wires, forming a sheet of ice from one wire to another, and the weight is sufficient to strain the wires to breaking point. In Persia the natives use the insulators as marks to test their shooting capacity, and it is impossible to obtain redress for the havoc they work. The frequent civil wars produce conditions in which telegraph lines come in for little consideration, and the linemen have to appear with their tools and supplies in the midst of the fighting.

The relay stations are provided with Wheatstone automatic repeaters, which introduce fresh battery currents into the system but do not call for a manual repetition of the message so that very much loss of time, due to delay in re-transmission, is avoided, the line is not overcrowded with delayed messages, and the instruments tick with practical simultaneity at either end of the long line. T.

A Lesson from France

M. R. PINCHOT, patriotically trying to induce us to afforest our waste places and conserve the forests that remain, must turn a somewhat envious eye upon France. She met his problem long ago and solved it as he would like us to solve ours. Whether she had to deal with the conditions that are present in this country, one does not know.

About a century ago—to give one example of her work—2,500,000 acres of the Department of Landes was mainly shifting sand-dunes and malarial marshes. The whole of it was planted with pine and is now practically a great pine forest. The sand has consequently been fixed, has blended with decaying needles from the trees, and is rich soil. The tree roots have penetrated the formerly impervious clay upon which the marshes rested, and opened channels to the spongy soil below. So the miasmatic climate has entirely changed: the whole region is balmy and healthful, whilst the many industries which depend upon pine forests are prosperously active. Manufactures of rosin, tar, turpentine, pitch, and the like, are everywhere in progress. STUDENT

Art Music Literature and the Drama

Art and Music Essential to Development

IN a recent debate at the Senior Boys' Brotherhood Club at the Theosophical Headquarters, Point Loma, the subject was, "Resolved that Art and Music are merely Adjuncts of Life and not Essential Factors in Human Development." The controversy really turned upon the meaning to be attached to the words *art* and *music*, the affirmative side naturally striving to depreciate them as much as possible, while the negative sought to give them their highest meaning.

Plato says that through a love of the beautiful the Soul obtains a reminiscence of its beatific state as untrammelled by the body; and that by cultivating this love of the beautiful we help the true progress of our development, which is to realize the inner in the terrestrial life. It is characteristic of all human existence to feel the contrast between the ideal and the actual and to have the experience of being a Soul imprisoned in a body. This dual nature of man is the essential feature in human nature. Human life on earth is an unrelenting effort to adjust, raise, and subliminate the conditions of terrestrial life so as to bring them more into harmony with the ideal of perfection with which we are inspired by the Soul. We are dimly conscious of an evanescent spirit vaguely called Beauty, which is most ardently desired, but which continually escapes us. We seek it first in beautiful forms, beautiful sensuous impressions, and pleasures; finally we realize that its only lasting home is in the inner Man, and that beauty of life, beauty of conduct, beauty of deeds, is our real goal.

By means of the arts, both contemplative and creative, we are enabled to give expression to our love of the beautiful, thus strengthening that love and making it a power in our development.

We can point with confidence to the pages of history in support of the claim that various phases of the romantic movement have from time to time burst forth as an antidote to deadly dulness, materialism, and stagnation. Whether it be poetry, like that of Tennyson, novels of human kindliness, like those of Dickens, drama like Shakespeare's, new movements in the graphic and decorative arts, or new inspirations in music—all have played their important part in keeping alive aspiration in the human breast. It may be freely admitted that these movements have been liable to every kind of perversion and have run into follies, hypocrisies, and frivolities; but nothing in this world is free from such contamination, and despite all the drawbacks and counterfeits, there has been enough of the genuine spirit to fulfil its purpose, even though imperfectly.

Those who argue that the arts are merely feeble imitations of nature, and that there-

fore it were better to go to nature herself, are reminded that art is not merely contemplative, but also creative. No one with a vestige of artistic instinct is free from the desire to emulate works of beauty and perfection; and in the larger significance which it is legitimate to give to the word *art*, the gardener striving to raise the best produce, and the bricklayer striving to build the best wall must be included among artists. The very savage is driven to express the creative spirit in his carvings and fabrics, and there is nobody who does not in some way or other evince the fact that art is an essential factor in his life.

THE DAIBUTSU OF NARA, JAPAN
(COLOSSAL SITTING STATUE OF GAUTAMA BUDDHA)

It is true that a love of the beautiful may be degraded into a love of sensuous gratification, and that the name of art may be invoked as a means of ministering to vanity. It is true that there is a world of cant, mutual deception, and self-deception connected with the name of art, musical, graphic, or otherwise. And it is consequently true that anyone who confines his definition of the word *art* to these cases may put up a plausible argument in favor of art being a mere adjunct. But he misses the spirit of the question and takes advantage of the mere verbiage.

The love of beauty, harmony, perfection is the motive power of human development; and the arts are the means of cultivating and expressing this motive power. And man can never abandon the quest of the beautiful; for, if he misses it in one form, he will seek

it in another. Degradations of art will inspire him with disgust, and he will sweep them away only to continue the quest.

And what is the ultimate goal? Do not experience and philosophy tell us that beautiful forms and sensations can only lead us part way on our pilgrimage; and that though our quest for beauty and truth in these forms helps us along our path, we can never find full satisfaction in them? After many illusions and disillusionments, man finally discovers that there is one place where he can always find beauty, and whence it can never be taken away, and that is in his own Heart. He will make his life beautiful; in that realm he is master; in that field he has infinite conquests; there he can rear eternal fabrics.

Perhaps we have externalized art too much, as we have externalized our God. Perhaps we ought rather to *be* music than to enjoy it. Those sublime strains ought to remind us of an inner harmony that we have lost and seek to regain. But it is never in personal gratification that we can find the beauty we yearn for. The conditions for the creation of harmony are unity in multiplicity, concord among the varieties. We cannot create music by retiring to play on our own instrument alone; we must be of the orchestra. We cannot sound one note or paint with one color. The promptings of the personal nature are like discords and ugly forms; and in art and music we may find the key to an underlying harmony in life. They may teach us to see the beauty of our Soul—of our neighbor's Soul; to recognize the harmonies instead of the dissonances, in our mutual relations; to perceive the real beauty that is in life instead of pining for an unattainable happiness. What we have called life may not seem to be worth living, but real life is music and the greatest of the arts is the art of living. It is Theosophy alone that can teach men how to live. E.

Literary Jottings of the Poet Shelley

TEN thousand dollars was the price recently paid for three little notebooks that had belonged to the poet Shelley. They were purchased by an American and a movement is on foot to have them printed *in toto* or in part. Some years ago Rossetti made a good beginning of editing them, but a more difficult task could hardly be imagined, for they contain a veritable pot-pourri of literary material—quotations and paragraphs in several languages, among them Greek, Latin, Italian, Spanish and French, most of these unaccented and nearly all guiltless of references by which they might be traced. There are also bits of original prose and verse; and the pages are dotted with curious little pen sketches also, mainly of heads. STUDENT

I am the same to all creatures; I know not hatred nor favor.

Krishna in the *Bhagavad Gītā*

THE position of many women in the East, without the light thrown upon present conditions by the teaching of Rebirth, to any loyal member of the sex appears appalling. But with this Theosophical teaching to bring to bear upon the question, what hope and enthusiasm, free from any irritable desire to be hastening changes before the moment is ripe, stir in the hearts of the women whose *esprit de corps* leads them to ask for their comrades in the East all possible opportunities for developing the royal womanhood the world needs.

Mr. Hall Caine, who has been some years in the East, has been writing a short series of articles on this subject in the London *Telegraph*. He describes the degradation, physical and spiritual, which is woman's lot where the teachings of Islam have so long departed from the earlier aspect of the faith that those who are most orthodox are now, many of them, most guilty of subversive interpretation of the teachings of the Prophet, and most flagrant in departing from the moral standards, especially in regard to women, which were inculcated by Mahomet and his immediate followers.

Highly intelligent and earnestly loyal Mohammedans assured Mr. Caine that the condition of women is due to the *Islamites*, not to the teachings of Islam. Mr. Caine himself advocates the moral education of the Eastern man where women are so helpless, the whole situation being in the hands of men.

The general absence of any home life in the sense in which we have found it an inspiration and a unifying force; the absolute dependence of the wife upon the whimsical inclination of her husband, who may divorce her at will; the inharmony created by the custom of wearing the veil until after the marriage is performed, the persons most concerned being entirely unacquainted until the moment after marriage when the veil is lifted; the non-existence of the responsibilities of motherhood

The Eastern Woman

as we understand them, calling out as they do in the West the innermost strength and most untiring unselfishness; the prevailing recognition that women are so inferior that they may be assigned to the most wretched quarters even in homes not restricted by poverty; the total absence of any instruction, mental or

after they have succeeded in accomplishing this atrophy of their womanly nature, and where they can experience the bitterness of the lack of opportunity to share fully in the guidance of youth? So long as there are women who, though the opportunity for better things offers, are content to be the playthings of men ignorant or careless of woman's possibilities, will there not be conditions where women, from excess of limitation to an employment once chosen, may at last suffer the extremity of degradation and weakness that marks the end of this course?

The human race consists of souls who incarnate now here, now there; they are not restricted to any one race, but are born where conditions offer the experience needed. What is to prevent the souls of those who have accumulated irresponsibility by failing to be responsible, from seeking just such lives as that in a harem? It would be a natural consequence. And what more natural than that women who have suffered enough from the seclusion and degradation of the more benighted classes in the Orient, should rush to the other extreme when they return to earth life, giving us our most undesirable element in the West?

When one sees on the streets of our cities half-grown girls clad in conspicuous attire, flaunting along, alone, on bicycles, or parading the board walks with young men whose acquaintance they have made in the course of an outing; when, to pass to another stratum of society, we hear of the license permitted to college girls in their sorority-houses, the absolute failure to protect these girls from the dangers besetting them in the course of their gay life, do not one's thoughts fly to the seclusion and the veil of Eastern women as the natural mark of the pendulum on its return swing?

The problems of womanhood in the East and in the West have an underlying relation in the

THE SEA-WEED

THE flying sea-bird mocked the floating dulse:
"Poor wandering water-weed, where dost thou go,
Astray upon the ocean's restless pulse?"
It said, "I do not know.

"At a cliff's foot I clung and was content,
Swayed to and fro by warm and shallow waves;
Along the coast the storm-wind raging went,
And tore me from my caves.

"I am the bitter herbage of that plain
Where no flocks pasture, and no man shall have
Homestead, nor any tenure there may gain
But only for a grave.

"A worthless weed, a drifting, broken weed,
What can I do in all this boundless sea?
No creature of the universe has need
Or any thought of me."

Hither and yonder, as the winds might blow,
The sea-weed floated. Then a reflux tide
Swept it along to meet a galleon's prow—
"Land ho!" Columbus cried.

Elizabeth Cavazza (Selected)

spiritual, that is common in Mohammedan countries—all these are dwelt upon by Mr. Caine and make a depressing picture.

There is a balance in human development, however, though it is not always perceived. So long as there are women who, because of their selfishness and indolence, are smothering out the mother instinct, will there not be conditions in the world in which they can live

unawakened nature of women. If you are fully aware of all the conditions of life in Christendom, you will not waste much time merely deploring the sad case of the Eastern woman. You will realize that somehow or other, women must be or do something to awaken their own souls and the souls of their sisters, be they Christian or Mahomedan.

The hopeful aspect remains to be stated. The reports that reach us from time to time of the noble spirit of patriotism of the women of Turkey and Persia, and the culture of some fortunate Egyptian women, who have evidently outgrown the environment polygamy offers, and stand, even while still veiled from the outer world, as the comrades of their husbands, indicate that a new order of things is at hand. They indicate that Souls who do not require the limitations of the usual Oriental life are incarnating in the Orient, and that the bonds will have to burst because there is within these Souls the power to create an environment that will permit the flowering of much that has lain dormant because no other race has offered the opportunity of a life based on a national heredity of capability for intense devotion, and the ripe moment for the Oriental awakening had not struck. Not all the din of the West could awaken before the cyclic torpor had run its course.

The Western woman cannot do the woman's work of the world alone. She needs the co-operation of the women of the East, who will bring a maturity and a devotional serenity sorely needed in the field in these days when there are so many women who lash the world's problems to the accompaniment of their irrepressible irritability. A great danger ahead of the Oriental woman is the invasion of some of our mistaken Western methods of attempting to help the sex.

The writer of the articles referred to makes a telling point when he states his hope that the worshipers of Islam may be turned back to the great thoughts of the great Teachers. This, really, is what is needed. And what but the teachings of Theosophy can accomplish it? Katherine Tingley years ago appealed to the Hindûs to return to the purer teachings of their own religion. With Theosophy in the world as it is today, living, active, practised by thousands to the extent that they have endeavored to live for others, there is a revival of devotion which must quicken the stream in any faithful heart and enable a fresh influx from the Source of Truth to enter. Once let this awakening devotion be expended on the ideals of Ancient Truth, there will be new hope.

In this we see the solution of the problems not only of the Eastern but of the Western woman, for both need to cultivate a sense of responsibility to duty, both need to awaken the Divinity within that at present is lost sight of because of the selfish misuse and neglect of divine powers. Head, hand, and heart, must be disciplined and their energies unified and conserved before the real life can ever be lived by either men or women. STUDENT

A Woman's Opportunity

AT the last annual meeting of the British Medical Association, in Belfast, Ireland, honorary life membership was conferred upon the Countess of Aberdeen in recognition of her great work as President of the National Health Association of Ireland and the splendid campaign she has carried on against the spread of *phthisis*. This is the first time this honor has been conferred upon a woman in the history of the Association.

At the ladies' reception Lady Aberdeen spoke of the work of the Woman's Health Association which she had inaugurated to

yond the strict limits of hygiene, and affects life at various points—economic, moral, scientific, and social. Here is one of the peculiar opportunities for broad-minded large-hearted women to fill a gap between scientific theory and practical utility; to translate the technical knowledge of specialists into common sense for everyday use. The medical profession has found a bettered hygiene to be so effective in controlling *phthisis* that it has given an impetus to preventive treatment along other lines. The doctors, however, are so associated in the public mind with drugs and disease that a general campaign of education under a popular and devoted worker like Lady Aberdeen is more immediate and far-reaching in its results because her sympathetic understanding of the mothers and the needs of the homes wins the needed co-operation. Her method also has an evolutionary value in carrying out the ideas beyond the routine prevention of disease by public health authorities who vicariously operate to save many thoughtless persons from sickness instead of stimulating the individual's desire to work out his own hygienic salvation.

The lectures, which are given with graphic stereopticon pictures of diseased tissue, are a good antidote to the narcotics of "Christian Science" which would soothe the physiological law-breaker into the delusion that however he err he may escape the penalty by selfish persistence in willing good health for himself. The success of such a normal campaign also carries a convincing reproof for the unwholesome tendency now prominent in medical circles, which aims to combat disease by the use of animal serums and anti-toxins.

In short, this is the kind of science and religion of which there is no over-production in the ranks of well-meaning workers. What the world needs most is to know *how to live*, and this is no more true of the poor and the middle class than of those whose position and fortune provide more favorable external conditions. The ration-ale of light, air, sunshine, and proper food and clothing logically leads to the deeper truth that a clean, contented, genial, useful life is also essential to health and happiness.

Wholesome living means that the whole nature shall be operating rightly; and perfect health, like all other questions, works down ultimately to a moral basis. It takes moral stamina to do the right thing—even to keep the hygienic commandments; for aside from external sanitation, ideal poise, strength and agility of mind and body depend largely upon the spiritual will which refuses to yield to the varied caprices of inertia and indulgence.

This public spirited work is not without a meaning for the social agitators who would make economic conditions account for everything, including human nature and the status of racial development at any given time. So many would-be leaders, in their denial of any unselfish motives to the leisured class in dealing with the workers, fail to see that the "one sin of ignorance" is common to all. R.

THE "LANDHAUS," GRAZ, AUSTRIA

arouse the women of Ireland to a sense of their peculiar responsibilities in regard to the health of their homes and of their nation, and to show them how they might increase the strength and vigor of their race by combating the special diseases which were injuring the Irish people. The work was divided into three sections: (1) Anti-tuberculosis; (2) Combating infant mortality; (3) School hygiene.

At the Tuberculosis Exhibit, which had visited fully eighty districts in Ireland, the eagerness with which the people sought for guidance in fighting the white plague was described as most pathetic. The visit of the Exhibit usually resulted in a branch being formed, and everywhere a lively interest was manifested in the subjects presented.

The influence of this noble work goes be-

OUR YOUNG FOLK

The Râja Yoga System of Education

RÂJA YOGA as a system of education is certainly unique, and looking at it from every side we find that it embraces all subjects; and it not only includes all but deals with each in a manner so thorough that even the smallest minds must recognize in it a power for good.

That it is different from other systems is hardly necessary to state, yet there are many who ask wherein this difference lies. Have you ever stopped to think of the contrast between a man who realizes he is a soul, and one who apparently knows nothing of his higher nature? The application is very close, for Râja Yoga teaches that we are *divine*, and even the smallest child realizes that he has a higher nature, and that he is more than a mere machine, or an animal. Book-learning does not constitute the *all*, and yet in so many schools the prevalent idea is that if you have taken a certain number of courses, and passed through so many books of history, science, Latin, etc., you are educated and prepared to meet the world in all its various phases.

Such a thing is impossible, and as a result we daily meet with men and women whom the world has termed *failures*.

How many ever ask themselves who they are, or what they are here for? Very, very few, and so they drift along from day to day, carried first this way, then that, as a leaf is drawn along the current of a stream, and with no more purpose either. Finally the end of this life is reached, but why are they there, and why was the beginning ever made? They cannot tell you; no, for their education never taught them that, or how to open their eyes and discover it for themselves.

Râja Yoga is the opposite of this; it is a light where all else is darkness. Those who have come under its wide-spreading influence realize that "Knowledge of Self is Wisdom itself," and their efforts are directed towards a greater understanding of the first principles of life.

We know that human nature is dual, and this fact alone should put us on our guard, for by it we understand that there is a war in each of us, and on our unswerving vigilance depends the victory. This also Râja Yoga teaches.

Life itself is a wonderful school, and its books are full of the deepest truths; but only the few have so far been able to interpret them. The education received in most schools today would not form a key strong enough to unlock the clasps of even the first volume. And why? Because it is all too often a matter of theory, and carries the student no farther than graduation. Râja Yoga as applied by Katherine Tingley to the most difficult problems of life, can in its boundless scope supply an answer to each. It is not measured by so many years, or a certain number of degrees; it is ever present, and a faithful guide through an endless succession of lives.

More than once, interested visitors have asked how the life and education at Point

Lomaland Photo. and Engraving Dept.

AMONG THE PENTLAND HILLS, SCOTLAND

THERE is no better way to glory than to endeavor to be good as well as to seem such.

Good men must let the world see that their manners are more firm than an oath.

In the life of man, as in an image, every part ought to be beautiful.

An honest death is better than a dishonest life.

Socrates

Loma were to prepare us for the temptations of the world. The answer is simple, but before giving it let us look at the subject for a minute. After carefully studying the cause of the great wrong in the world today, it soon becomes evident that we are not masters of ourselves, or we would not succumb to the force that is hurled against us. If that be the case, is it not a bit of false logic to reason the way so many do? Now let us hear the answer that Râja Yoga gives. All temptations are to be found within ourselves. The various types seen in the world are but the same seen under another guise. Our passions, which rule so many of us, are easily attracted by the glamor which seeks to lure them on, and we, like a ship without a rudder, are powerless to stem the tide. It follows then, that if we become the masters, and make our passions subservient to the slightest impulse of the Higher Self, the Divinity within us, we are building day by day a tower of strength so impregnable that all the temptations of the world could not have an effect upon it. Not only does Râja Yoga give this as an answer, more than that, it is proving it to be an absolute truth.

There is such a lack of balance everywhere today. One faculty is developed at the cost of another, sometimes of many others; and such a thing as a well-rounded education seems to be non-existent. Humanity has lost the art of making each branch serve as an attribute of another. There is not such a thing as harmony, and in the many discords which have arisen, each note remains by itself, re-

fusing to blend with others in order to form a perfect whole. Where is that love of Brotherhood that should be in the heart of each? Why is *gain* the end for which so many sell their very souls? Do people imagine that they can go on and on in this terrible round of existence forever, or that love of self will lead them to a higher path? If such be the delusion, let us pray that their eyes may be speedily opened. And what is to show them the light, to help them to gain the balance they have lost? *A higher system of education*; one that will begin with the cradle and extend beyond the grave.

Verily Râja Yoga has a wonderful significance; and "Kingly Knowledge, or the perfect union of all the faculties, spiritual, mental, and physical," will truly prove a balm to this distracted age.

To those who have felt the influence of Râja Yoga, life is indeed joy, and every hour, nay, every minute, brings a new and deeper understanding of its meaning.

Katherine Tingley by her noble example is bringing before the world fresh proofs of the inestimable force of Râja Yoga. The children at Lomaland are taught that they are here for a great purpose. All are but parts in a wonderfully formed whole, yet each by itself may constitute a work of art, and by its co-operation add to the beauty of that structure of which it is only a part.

Selfishness, the root of all evil, must be cast out from our lives, and each one of us should realize that though we possess the most priceless gifts, they are ours only so long as we put them to an unselfish use. True education should recognize this, and endeavor to perfect each branch to such an extent that we should be capable of imparting our knowledge to others. We have never truly learned what we cannot share.

In a word, we live to learn, and Râja Yoga would also teach us to *learn to live*.

THE CHILDREN'S HOUR

The Star-Children

THE Star-Children were gathered together in the beautiful palace garden of the Land of Light. Sweet songs of birds, sweet scents of flowers, and a blaze of living light and color completed the fairy scene. Each child moved, a picture of flashing light, a sound of fairy bells, in that land of harmony and joy where brotherhood reigned supreme.

It was the custom now and then for all the children in the land to gather round the Lotus Fountain, and the King and Queen would come among them and the King would gently touch their hearts with his finger of light and the Queen would enrobe them in a dress of her weaving, of many hues; and those so chosen from among the band, knowing that the time had come for a far journey, walked to the confines of the kingdom with the King and Queen to receive last words of wise advice. He sang of the Sacred Tie of Unity binding all hearts together; of the precious treasures of Love, Trust, Purity, Faith, Hope, Reverence, Courage, and Compassion, entrusted to each, the weapons of the Warrior which increase in power through use, and rust when left in idleness, and the song grew intense in force and sweetness with the farewell words, "Remember your Unity in the Land of Light." Then the gentle Queen wrapped them in a cloak of darker hue. They slept, and when they woke, it was another land they were living in. But, as a rule, they did not know that; for to most of them after their sleep, it seemed as if they had been in their new home a long time, and their life in the Land of Light seemed just a dream, when not completely forgotten. To a few came a gleam of memory with every sunrise and sunset glow, and an echo of the King's parting words still lingered with them, and so they loved their little brothers and sisters and friends with a heart-whole love, in the "dark world" they now found themselves upon.

One such child was little Lucy. She was a fortunate little girl, for her mother remembered too, and even her father said, "Maybe, child," when she asked if he thought the great golden globe of light she saw in the sky might be the reflection of the palace lights in the land from which she came, and he called her his "Child of Light."

One day her father and mother told Lucy that they were going to take her for a trip round the world, and Lucy jumped for joy. On the big boat that took them across the wide blue ocean, Lucy met another "sunshine" child, and they had such happy times together. You see they knew from the beginning that they were old friends and had come down at the same time from the Land of Light; for their birthdays were actually on the same day,

A LITTLE FRIEND

"HE that hath grown so foolish-wise
He cannot see with children's eyes,
He hath forgot that purity
And lowliness which are the key
Of Nature's mysteries."

and they often talked happily together of the Beautiful Land.

At last they came to a lovely country called California and the children were greatly interested in a story they heard soon after they landed, of a beautiful place near-by where there was always music and all the people believed in Universal Brotherhood, and they whispered to each other of their hope that it might be their own beautiful home. How delighted they were when their mothers told them that they were going there.

Vera and Lucy never forgot their first day at Lomaland, for they found so many of their old companions there. They knew they were Star-Children as soon as they saw them, for they heard the fairy bells ringing in their voices and saw the light in their eyes and they never had a doubt about their remembrance of the "Sacred Tie of Unity" after they once clasped hands.

"It is very like our olden home" said Lucy to one white-clad, flower-crowned maiden there. With a radiant smile and a ripple of musical sound she answered:

"Truly it is a reflection of the 'Land of Light' upon this 'darker world.' Some wise people call it 'The Kingdom of Heaven on Earth,' for, you know, one of the Princes of the Land of Light said that we came here to let our Light so shine that the people of this world might grasp the joy of the 'Life Beauti-

ful,' and make their present home a picture of their true home; and we children know that it is the Spirit of Universal Brotherly Love that will do it, do we not, beloved co-workers?"

And they answered, "Thou hast spoken truly." STUDENT

The Music of the Fishes

WE do not usually think of fish as being rivals of the songsters of the air, but travelers in all parts of the world report the musical sounds made by them. The music of the fish is described as being most strange and weird, and yet enchanting. It is nearly always heard about sunset and does not last far into the night.

There are about three hundred fishes which have the power to produce vocal sounds. A fish is found in the Cambodia River, which, by adhering to some substance by the mouth, produces sounds likened to the ringing of bells, the bass notes of an organ, and tones from a harp. In the rivers of Borneo there is a similar fish which attaches itself to the bottom of boats and makes a sound like a jew's harp and as it increases in volume, resembles the deep notes of an organ. One traveler in Borneo tells of a beautiful concert heard one night on the Pontinjac River. Sometimes the music seemed to come from the distance and at other times from near-by, and changing from the deep organ-like tones to the sweet and delicate tones of an Aeolian harp.

Another traveler describes the music of the fish in Lake Batticalao, in Ceylon. Choosing a calm night when the moon was nearing the full, he rowed out into the lake. He describes the music as being most beautiful, and says that he could hear it much more plainly by placing his ear against the woodwork of the boat.

The muddy creeks and shoals around the harbor of Bombay are also the homes of musical fish. The long drawn out musical tones, resembling the strains of an Aeolian harp, bells, and a note from a pitch pipe, are very familiar to the native boatmen. Very beautiful music is also heard on the Pascagoula River in the state of Mississippi on a summer evening. It is very soft and sweet and is also like an Aeolian harp. The slightest disturbance causes it to cease. The Indians have a beautiful legend connected with it which is only one out of the many attached to this curious music. It has been suggested that the legends of the songs of the sirens have their origin in the music of the fishes. Doubtless there is much music among the lower forms of the animal kingdom, which the human ear of today cannot hear; for to many even the music of the fishes is as yet a thing that is quite unknown. THE MYSTERIES OF THE HEART DOCTRINE

PREPARED BY
KATHERINE TINGLEY
AND HER PUPILS

The Theosophical Book *of the* Twentieth Century

Tells the story and the history of the Theosophical Movement.

The prices are \$2 in cloth and \$1 in paper, which barely cover the cost, for it is printed and bound, not gaudily, but with such carefulness and thoroughness of art and craft as to make it unique among modern edition books.

ORDER FROM THE
THEOSOPHICAL PUBLISHING CO., POINT LOMA, CAL.

Isis Conservatory of Music OF THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY POINT LOMA, CALIFORNIA

Personal applications and inquiries received every Saturday
by the Secretary at SAN DIEGO BRANCH

ISIS HALL, 1120 FIFTH STREET

between the hours of 9 A. M. and 4 P. M. Full particu-
lars will be sent by mail upon application to

J. H. FUSSELL, SECRETARY AND TREASURER,
ISIS CONSERVATORY OF MUSIC, Point Loma, California

SOME OF THE ERRORS OF CHRISTIAN SCIENCE CRITICISM

BY H. P. BLAVATSKY AND WILLIAM Q. JUDGE

CONTENTS

"The Empty Vessel Makes the Greatest Sound"
A Note of Warning

—by H. P. Blavatsky

Of "Metaphysical Healing"

Affirmations and Denials

The Cure of Diseases

Replanting Diseases for Future Use

—by William Q. Judge

A MOST VALUABLE PAMPHLET. Outside of Theosophy there is given no adequate explanation of the healing that is at times accomplished, nor of its *rationale*, nor of the ultimate price that must be paid and the dangers connected with such practices.

This pamphlet is invaluable to all students.

The Presidential Address of the British Association

PROFESSOR J. J. THOMSON, President of the British Association, in his address at the recent Winnipeg meeting, gave a résumé of recent advances in physical researches and theories. He said that the study of gases exposed to Röntgen rays has revealed in such gases the presence of particles charged with electricity, some with positive, others with negative. The properties of these particles have been investigated; we know the charges they carry, the speed with which they move under an electric force, the rate at which the oppositely charged ones re-combine; and these investigations have thrown a new light, not only on electricity, but on the structure of matter.

We know from these investigations that electricity, like matter, is molecular in structure; that just as a quantity of hydrogen is a collection of an immense number of small particles called molecules, so a charge of electricity is made up of a great number of small charges, each of a perfectly definite and known amount.

Helmholtz said in 1880 that in his opinion the evidence in favor of the molecular constitution of electricity was even stronger than that in favor of the molecular constitution of matter. How much stronger is that evidence now, when we have measured the charge on the unit and found it to be the same from whatever source the electricity is obtained.

Particles of Electricity

But the size of the particles of electricity is very much smaller than that of the particles of matter; and the reason why, in spite of this, we know more about the former than the latter is that it is so much easier to detect a charged particle than an uncharged one. With regard to uncharged particles we are told that Strutt has shown that the amount of neon in one-twentieth of a cubic centimeter of air can be detected by the spectroscope, although, as Ramsay has shown, the proportion of neon to air is only 1 to 100,000. Yet in this small volume there are about ten million million molecules—about 7000 times the population of the earth—and, as Professor Thomson says, if we had no better test than this for the existence of man we should conclude that the earth is uninhabited. He thinks we shall arrive at a knowledge of the ultimate structure of electricity before that of matter.

The most natural view to take, as a provisional hypothesis, is that matter is just a collection of positive and negative units of electricity, and that the forces which hold the molecules together, the properties which differentiate one kind of matter from another, all have their origin in the electrical forces exerted by positive and negative units of electricity, grouped together in different ways in the atoms of the different elements.

Negative electricity is made up of units all of the same kind; their mass is only 1/1700 of the mass of a hydrogen atom, their radius being 10^{-13} centimeter. These corpuscles can be obtained from all substances; their volume bears the same relation to that of the atom as a speck of dust to the volume of a lecture hall. Under suitable conditions they have enormous speeds, approaching in some instances the velocity of light.

As to whether these corpuscles are charged masses, or whether they are all charge, it is stated that it has been shown mathematically that the mass of a body must be increased by a charge, but that the increase is greater for small bodies than for large. Now even the atom is far too large for any appreciable increment of mass to be noted when it is charged.

Less Mass --- More Potency

But in the case of the corpuscle, the proportionate increase is so great that as shown by the experiments of Kaufman and Bucherer, the whole mass of the corpuscle arises from its charge.

We do not know yet whether there are definite corpuscles of positive electricity, or whether what we take to be such are only atoms from which negative corpuscles have been abstracted. Investigations seem to show that the positive corpuscle, if it exists, is much larger, being comparable, if not equal, to the hydrogen atom.

Regarding the enormous fund of latent energy in matter, the following is stated. The smaller the charged body, the greater the energy of the charge. Each corpuscle has 8×10^{-7} ergs. In one gram of hydrogen there are about 6×10^{23} atoms. Assuming that the charge consists of but one corpuscle to each atom, the energy in a gram of hydrogen would be 48×10^{16} ergs, equal to that yielded by the burning of five tons of coal. The energy developed by one gram of radium is nearly equal to the burning of one ton of coal.

The Etheric Substratum

The Professor next considered the ether. The matter which builds worlds he compared to a few islands in a boundless ocean of ether. We have to accept the existence of this ether in order to explain the transmission of light and heat from the sun and the enormous stresses which keep the planets circling in their orbits. The theory of light now generally accepted is the electro-magnetic theory; and Clerk Maxwell has calculated the equations expressing the relations between the forces in the ether. But, complains Professor Thomson,

They do not tell us very much about the nature of the ether. The interest inspired by equations, too,

in some minds is apt to be somewhat Platonic; and something more grossly mechanical—a model, for example—is felt by many to be more suggestive and manageable.

Is the ether dense or rare? Has it a structure? Is it at rest or in motion? Experiments on the pressure of light enable us to calculate the mass of the ether that is disturbed by a ray; and it is found that in a cubic kilometer of ether carrying light as intense as sunlight on the earth's surface, the mass moving is only one-fifty-millionth of a milligram. This, however, is not the mass of a cubic kilogram of ether, but only the mass of the moving part. The place where the density of the ether carried along by an electric field rises to its highest value is close to the corpuscle. It can be calculated that the density here must be 5×10^{10} , or about 2,000,000,000 times that of lead. Now, if ether is compressible, this may not be its usual density, but only a concentrated density caused by the tremendous stress under which it lies in that particular situation; and, if it obeys the laws of a perfect gas, the density being proportional to pressure, its density at ordinary atmospheric pressure would be only 8×10^{-16} , or a cubic kilometer would weigh only a gram. But if it is not compressible, then the whole ether must have a density two thousand million times that of lead.

The Professor enters into some speculations as to the nature of energy. We may regard potential energy as the kinetic energy of portions of the ether, and then all energy is kinetic energy, due to the motion of matter or of portions of ether attached thereto; and the ether is a bank of energy where we may deposit or withdraw. (It certainly is difficult to imagine what else potential energy may be; what conception can we form of a tension or attraction? These notions are now being replaced by that of pressures due to motion.)

With regard to radio-activity, Professor Thomson said that it was one of the most important and interesting advances ever made in physics. The properties of radium have completely altered the aspect of one of the most interesting geological problems, the age of the earth. And he concluded by saying that

The new discoveries made in physics in the last few years, and the ideas and potentialities suggested by them, have had an effect upon the workers in that subject akin to that produced in literature by the Renaissance. Enthusiasm has been quickened, and there is a hopeful, youthful, perhaps exuberant spirit abroad, which leads men to make with confidence experiments which would have been thought fantastic twenty years ago. It has quite dispelled the pessimistic feeling, not uncommon at that time, that all interesting things had been discovered. . . . In the distance tower still higher peaks, which will yield to those who ascend them still wider prospects, and deepen the feeling, whose truth is emphasized by every advance in science, that "Great are the Works of the Lord."

The above might be summed up by saying that the results of research into nature have vindicated logic and confuted fallacy. Formerly light, heat, and electricity were explained solely on the dynamic principles relating to large masses. Just as, in practical mechanics,

masses in motion exert forces and are said to possess energy; so it was argued that heat, light, and electricity, are the result of masses in motion, the masses in this case being the hypothetical atoms. Nay, even thought was regarded by some as being of this nature. But logic showed that if heat, light, and electricity are only the results of masses in motion, then it becomes necessary to postulate other agencies as the causes of such motion; and now we find that heat, light, and electricity are actually those agencies. The situation is completely reversed: the effects have become the causes; instead of matter generating electricity, matter is made of electricity. Instead of taking mass as a fundamental unit, we are now speculating what it is.

But still we cannot get away from the mental necessity for postulating some kind of material substratum; only we have now a sea of ether. In speculating as to the nature of this ether, we are compelled to use again the same formula of atomic structure and its accompaniments. The laws of thought compel us to do this.

We shall never discover the origin of force nor the true nature of substance by physical research alone, whether perceptive or conceptive. To achieve this, it is necessary to recognize that other and higher branch of science which makes the field of consciousness its domain. The universe can only be analysed into states of consciousness; though it may to a limited extent be represented by formulae useful for practical purposes. And to attain to knowledge we must study our own mind and consciousness, regarding the external universe as a function thereof. This was recognized by ancient science and will have to be recognized by modern. Yet before men as a whole can enter profitably upon such a study, is there not much clearing away of rubbish to be done? The selfishness, ignorance, and want of organization in our social life would render such a study liable to every kind of danger and abuse, as indeed we see in the history of the many wild crazes that are springing up everywhere. Reckless and ignorant free-lance dabbling in psychism is more dangerous than dynamite in the nursery; and discipline such as prevailed in the old Schools of the Mysteries must precede study in this department. Of far more importance to the human race at present is a greater knowledge of the *spiritual* nature of man and the means whereby man can rule and order his own kingdom. Until that preliminary has been attended to, *psychic* knowledge cannot proceed with advantage to the race. "Great are the Works of the Lord" indeed, but man must recognize that he is the Lord—not in his present dwarfed condition (it would be blasphemy to maintain that), but in the state to which he can attain, and is even now spiritually.

Meantime the psychic is confounded with the noetic, not only in the minds of the general public, but even in those of leading men of thought of different spheres. Hence the vogue of quasi-"occultism" and pseudo-Theosophy—attempts to invest the purely psychic with false glamors and suggestions of personal benefit and power. STUDENT

Earthquakes and Etheric Shocks

THE agitation exhibited by animals before an earthquake, and the nervous tension felt by susceptible persons, were noticed before the Messina earthquake. These facts, too general to be denied, conflict with all theories which explain earthquakes as purely mechanical phenomena. While the slipping of the strata may cause secondary shocks, that slipping is itself the *result* of the primary shock. The earth is not a disorganized mass of matter gravitating together or lying in an inert heap, as it were; it is a fabric that is held suspended by powerful tensions, like that aerial arch of iron dust that can be erected over the poles of a powerful electro magnet. Turn off the current, take away the magnetic forces, and the fabric crumbles. What would happen to matter, should the etheric forces on which it is strung be turned off? For the tendency in science nowadays is to regard matter in this way.

A shock to the invisible electric or magnetic atmosphere of the earth vibrates through its physical substance, affecting most the most unstable parts. Sensitive organisms feel the etheric tension before it produces its physical effect on the crust. This same etheric medium, which is, as it were, a kind of soul to the physical earth, is as a body to the thought-atmosphere of the world; so it acts as the link between mental and physical; just as in the human body the *linga sarira* is the link between mind and body, through which states of mind are transmitted to the body. When an emotion shakes our body, we have a kind of bodily earthquake.

The thoughts of men produce conditions in the world's thought-atmosphere, which from time to time grow tense and are relieved by seismic phenomena. The co-existence of powerful opposite charges of electricity is a similar case. The electricity causes the phenomenon of the storm; and some thinkers have tried to make an endless circle by attributing the electricity itself to physical causes. But the attempt to represent terrestrial phenomena as being a closed cycle of events is frustrated by the discovery that the sun has a great deal to do with the matter. So we have to take the sun into the equation of the "conservation of energy." And we ought also to include all the energies that move in the world of thoughts and emotions; unless we wish to create two worlds entirely separate from each other.

Electricity is one of the manifestations of the *vis viva* of the universe. It appears where there is contact between dissimilar substances, and under other well-known physical conditions; but it is not created thereby. It is far more the cause of physical phenomena than the effect. The connexion between our own vitality and electricity has often been noticed; and this makes a connexion between electricity and thought. STUDENT

The Chinook Wind

THE word "chinook" has suffered the same reversal of meaning as "Lucifer," the bright harbinger of Light. A "chinook" is the *winter* south-west moisture-laden wind that strikes the Pacific coast from north California to Alaska. Originally it meant the north-west *summer* wind that blew from the country of the Chinook Indians into the Willamette Valley, and was a "clearing-up wind." STUDENT

Some Views on XXth Century Problems

The Central Self

IF the great labor which some modern investigators are throwing into the endeavor to get proof of immortality were spent on the right field, they would find what they seek.

But they are looking away from that whose immortality is under question, towards that whose mortality is obvious — namely subtle or gross material form.

Can anything be immortal whose being began as the result of a mixture? What began sometime may cease sometime. Certainly any *element* of the mixture may be immortal, but surely nothing that owes its existence to mixture. If ego turns out to be something composed, what hinders that at some time it shall be decomposed? How could we ever feel secure in our selfhood if self is a compound?

The most recent of the books on immortality makes the soul the outcome of the conjunction and co-operation of certain forces working in an immortal "bioplasmic" medium. The conjunction results in consciousness; consciousness finally becomes self-consciousness; this then preserves itself, attracting about it, as vesture, substance of higher and higher tenuity, in fact transcendental "bioplasm."

But unless it can be shown that the influence causing the conjunction of those forces will be undying, what warrants the continuance of the conjunction? Oxygen and hydrogen unite to form water; individually they might be thought of as immortal; but if the force of inter-attraction be neutralized, the water will cease to be, notwithstanding that it might have been "spiritualized" into the most rarefied steam.

A conjunction of forces certainly occurs to constitute *brain*. But that which finally brought about the conjunction was the already self-conscious soul which uses that brain; and if it is to be argued that brain-memory is immortal, the argument must rest on the immortality of that which brought about and will maintain the conjunction.

The only immortality important to us is the immortality of self-consciousness, and knowledge of that can only be found within itself. We must disentangle person and self, recognizing that the highest function of the former is to reflect the latter, bringing the latter's being before itself as knowledge. Assurance of immortality will never come from reasoning. It only comes from steadying the mind upon the highest conscious state it can reach, a process described by many names, prayer, meditation, aspiration, and others. Each great religion has had its name for it, because just where the highest reasoned theology leaves off, this practice of religion begins. And it can be carried to fruition by minds that have not learned anything about the other; indeed it is easier for them, though in the end every man must and will have every faculty at its maximum. The human self in its essence is one with and derives from the Great Self and therefore comes to self-knowledge in the attempt to find that, gets it as it were by the way.

Some men by meditation, using contemplation upon the Self, behold the self within; others attain

to that end by philosophical study *with its realization*; and others by the consecration of all their works to the Self. Others, again, who are not acquainted with it in this manner, but have heard it from others, cleave unto it and respect it; and even these . . . pass beyond the gulf of death.

The chief sacred text-book of India had anticipated all our modern problems and taught the way of their solution. STUDENT

Fear

A MEDICAL contemporary points out that fear of insanity, in those who know themselves to be hereditarily disposed to it, is often a marked contributing factor in its outbreak. But while it admonishes the hereditarily imperilled not to give way to their fear, it does not show them any secure way of depriving the fear of its basis.

Yet a man can as readily train himself out of the tendency to insanity as he can train himself into a desirable mental aptitude or habit. There is no need for him to be the slave of a thought or feeling. He can easily acquire the power of standing back from his mind and watching its flow instead of being borne along with it. He should have been shown the power in childhood; but no modern system of education except Katherine Tingley's Rāja Yoga does that.

It is for instance a common delusion of the insane that a large number of persons are plotting against them. From that to concealed wires, projected forces, and threatening voices, the progress is easy.

The delusion begins quite gradually, the victim's nature being usually suspicious, secretive, and prone to make mental pictures of others which have no correspondence with the reality. Which is the same as to say that he is deficient in sympathy, compassion, understanding of human nature, and the power to forgive. And it is in acquirement of the power to forgive that the other qualities develop and that this whole group of delusions becomes absolutely blocked out of consciousness.

Nearly all the difficulties of life come from the confusion of self with mind and the consequent incomprehension of either. To hold them separate, to watch and control the latter by the essential, felt divinity of the former, is the key. It has been lost by the churches, and since for centuries they were practically the only teachers, it has been lost to the world. And the consequence of that loss is the state of the world, its insanities, suicides, and crimes. The very term self-consciousness, which means consciousness of self as self really is, as soul, as divine, as controller and user of the field of mind, planting in that field what it will and uprooting what it will — now means consciousness of what is precisely *not* self, of the appearance one will present to others, anxiety that that appearance shall impress them or not be ludicrous to them, and acceptance from their minds of the picture they have formed.

Self, then, the one natural controller of mind, having been lost sight of, the wonder is that mind does not more often — instead of so often — "run amuck" through its own

mazes and permanently lose its way therein.

But the man who fears insanity can very soon take control enough of his mind to make his fear baseless. He has but to find himself, taking compassion, forgiveness, and *light*, for his guides inward to the silence of his own sanctuary. He will there find *himself* and the greater Self of which he is a ray. The insanities and suicides of our time are due to want of exercise, spiritual exercise, a failure which is as naturally certain to produce mental disease as want of physical exercise will produce physical disease. And as it is only when physical inefficiency reaches a certain point that we notice anything — so general is this — and call it disease, so is it only when mental inefficiency or perversion is very marked that we call it insanity. None of us has perfect moral-mental health because of want of spiritual exercise. STUDENT

The Mechanics of Old Age

A SCIENTIFIC contemporary traces — at any rate for a majority of the cases — nearly all the train of physical symptoms of old age, to decrease of thought. During healthy brain activity, an activity which habitually breaks the bonds of routine, the whole body is slightly on tension. Proper thought, alert to itself, is a general invigorator and a preparative for healthy movement of any kind. It is known that when any cell is resting quite passive, in receipt of no stimulation, its bounding membrane becomes impermeable to dissolved matters in both directions. Its crystalline excreta accumulate within; no nutritive material gets in from without. Directly a stimulus reaches it, whether from the will or otherwise, the membrane becomes permeable; excreta are discharged and nutritive material from without is admitted.

Healthy thought, then, throws all the cells into this double activity — including therefore those of the arteries. The degeneration characteristic of old age commences in the muscular cells of the coat of the blood-vessels.

By middle life, habits of thought have usually come down to a routine; no new ground is broken; the mind runs over its set path of habit — is not, in a fuller sense, active at all. The body never gets the wave of stimulus resulting from breaking new mental ground, from energizing the brain cells to new connexions, from developing new intellectual interests and fresh touch with life. General stagnation begins, physically expressed by the retention of cell excreta. In the case of the arteries these retentions finally result in the chronic alterations characteristic of old age with all their secondary consequences.

To a degree it is therefore within the power of the will not to submit to old age, by appropriate physical exercise and developed intellectual interests to keep the cells alert and relatively healthy in excretion and nutrition far beyond the usual period of slackening. This was the secret of Gladstone. It is the secret — for it is that to most men — that we are triple in constitution, physical, mental, and spiritual, and that each part must be held alive by action of the several kinds. STUDENT

St. John's Gate, London

THIS Gate, situate in Clerkenwell, is one of the most interesting relics of bygone London. It is unique as being the only ancient portal remaining of the monastic buildings which were once so numerous in the Metropolis.

The Gate is inseparably connected with the Crusades, for it was the grand south entrance to the Priory of the Knights of St. John of Jerusalem, the chief seat of the Order in England. Mail-clad knights have passed through this portal on their way to the Holy Land, but its surroundings today are very commonplace. The Gate consists of a wide-arched passage with rooms on the East and West sides, and an upper story. On each face are two projecting towers, and the whole is surmounted by battlements. On the south face are shields bearing the arms of England and France.

The old gateway has seen many vicissitudes. The insurrection under Wat Tyler in 1381 raged about it, and the Priory was burnt, the Prior being beheaded in the adjoining Square. In the days of Henry VIII the buildings were employed as a storehouse for the king's "toils and tents for hunting and for the wars." Lord Protector Somerset blew up the greater part of the Church and the stone was used in the building of his house in the Strand, according to Stowe. The crypt still remains in a good state of preservation, and it was the scene of the exposure by Dr. Johnson and others, of the celebrated "Cock Lane Ghost" imposture. Many historical events took place at the Priory. One was the Aulic Council held by Henry II and his barons, when the Patriarch Heraclius and the Grand Master of the Hospitallers came to England to urge Henry to a new Crusade.

The still standing gate has literary associations too, of the greatest interest, for here lived Edward Cave, the founder of the world-famed *Gentleman's Magazine*, and Dr. Johnson in one of the rooms of the Gate wrote many of his contributions to it. Goldsmith and Boswell were among the visitors to Cave at the Gate, and here Dr. Johnson introduced David Garrick to Cave. In the room over the archway an impromptu theatrical performance once took place, Garrick, with the assistance of some journeymen printers who read their parts, giving a representation of the farce by Fielding entitled *The Mock Doctor*, adapted from Molière.

An old writer on Clerkenwell bewailed the fact that the Gate had fallen on evil times, "gin usurping the place of genius, and the stalwart warder being replaced by the landlord of the tavern." Happily things are not so bad nowadays, as great care is being taken of the relic. It is now the headquarters of the St. John's Ambulance Association, certainly a fitting use for it. LONDON STUDENT

ST. JOHN'S GATE, LONDON

Origin of the Hot Cross Bun

THE hot cross bun of Good Friday, says a contemporary, dates back thousands of years—which is doubtless true; but it adds, "to the very dawn of the human race"—which is a dogma, perhaps added by way of rhetorical flourish or to procure an additional line of copy in the paragraph. The bun is one of those heathen rites which have been adopted by the Christians "with a holier meaning." The adoption is admitted: the holier meaning is a question of opinion. Many a Christian edifice was built out of pillars plundered from pagan temples and palaces; many a heathen God and Goddess has been adopted as a saint and given a halo or a terrestrial cross in place of its original insignia; and many a symbol and ceremony has been taken over bodily and turned to a holier (or unholy) use.

Buns known by the same name were used in the worship of Astarte, continues the account, as early as the days of Cecrops, who is placed at 1500 B. C. Consequently the story that in the Middle Ages the church allowed buns to be eaten on the fast day, on account of a plague, but insisted that they should be marked with a cross, cannot be assigned as the origin of the hot cross bun. Such buns were used by the ancients as a protection against disease and danger; and in some parts of England bread is baked on Good Friday and kept until the anniversary, being used in the

meantime in small quantities as a medicine.

Humanity clings fondly to its scraps of ancient knowledge, and the churches adopt those which they cannot suppress, while science busies itself in providing various explanations. The explanation of the survival of these scraps is that the race has a racial mind or racial memory, very similar to that function in animals which we denominate "instinct." In this racial memory are stored up the items of former knowledge; but the ordinary conscious mind is not in touch with it, so that the memories present themselves in the form of instincts or customs, not understood by the reason.

Ceremonial eating and drinking are found in connexion with the worship of Ceres, and Isis, of Bacchus, etc; for a symbolic act, performed in the proper manner and right spirit, was justly regarded as a means of obtaining the grace of which it was the symbol; just as in the Christian Eucharist—an ancient sacred rite of the Mysteries, which has been so vulgarized that it is a laughing-stock with many people. He who could partake of the bread and wine in the full understanding that they represented the partaking of an inner food that feeds the inner man, probably would be able to profit by this ceremony. But it is scarcely prudent to say much on this head, as it is evident that many people would

turn it into a means of glorifying the personality and we might get some crank sect or cult that would prescribe ceremonial eating as a means of developing what they would call "will-power" or personal magnetism, thus feeding the passionate nature instead of the spiritual. STUDENT

Norwegian Discovery of America

A NEWSPAPER report dated from Chicago, May 22, states that positive proof has been found of the discovery of America by Norwegians more than 100 years before Columbus. A stone bearing a Runic inscription and the date 1392 has been found in Douglass County, Minnesota, and photographs of it sent to the University of Christiania, where no valid criticism of its authenticity was offered. The inscription relates that eight Goths and twenty-two Norwegians were on a voyage of discovery from Vinland westward. H.

"Br'er Rabbit" an Indian Tale

AN anthropologist has declared his conviction that the Joel Chandler Harris stories are not originally negro, but were handed down to the negroes of the south by the Indians. The Indians, he says, told these stories long before the negroes came, and the stories are characteristically Indian. He relates them to the subject of Indian mythology and symbology generally, noting that the Indians have their creation and flood stories, like those in the Jewish Bible. T.

✻ The Trend of Twentieth Century Science ✻

Some Alcohol Figures

THE recent (twelfth) International Alcohol Congress, held in London, produced some new and important statistics relating to the children. Professor Taar Laitinen, director of the Hygienic Institute in the University of Helsingfors, contributed the results of his examination of nearly 6000 families, comprising 20,000 children.

Excluding definitely drunken parents, he classified the rest into abstainers, moderates, and constant or regular drinkers. This scale of their use of alcohol is reflected exactly in the development of their children.

Using the eruption of teeth as an easy index of general development, he showed that at the end of the eighth month of life 42 per cent of the children of constant drinkers had no teeth; the children of moderate drinkers were farther on, only 34 per cent having no teeth; whilst of the children of total abstainers but 27 per cent had developed none.

Mortality told the same story. By the end of the eighth month 32 per cent of the children of the constant drinkers had died; 23 per cent of the moderates; and only 13 per cent of the total abstainers.

The regular increase of weight during the same eight months was exactly in line with the other figures.

These are of course but gross indications of finer effects upon the whole mass of body cells; effects the more radical because produced while those cells are in process of formation. Of this the Professor had some corroborative evidence from his own experiments. He had tested the bactericidal power of the blood of abstainers and drinkers, using the typhoid germ for his work. In all cases the use of alcohol was found to have lowered this indication of inherent vitality.

How much longer must alcohol be exposed before people refuse to tolerate the advocacy of its "moderate" use? STUDENT

The Astronomical Thread

IT is sometimes a very, very fine thread of reasoning that astronomy must follow, occasionally so fine as hardly to be a thread at all. But the vast problems have a fascination that will not be denied.

Does the Andromeda nebula, for instance, lie within or without our stellar universe? Is it another universe in an inconceivable beyond, or is it a bit of ours?

Ours is the Milky Way. The astronomer Gore calculates that if the Andromeda nebula is the size of the Milky Way, then, to reduce it to its apparent size it must be 150,000 light-years away. As light travels at the rate of about 190,000 miles a second, it follows that the hypothetical distance could hardly be written on one sheet of paper.

If the nebula contained about the same number of stars as the Milky Way, of about the same average brightness, then, at the said distance its total light would be equal to that of a star between the first and second magnitude. But its light is much less. It therefore

lies farther away than the said distance, or is smaller or dimmer than the Milky Way.

But there is a particle of what may be evidence that it is neither. A good many years ago a temporary star blazed out at a point in space which *on the flat* was near the middle of the nebula. But *linearly* it may have been on this or the farther side of it. Assuming that it was neither, but *in* the nebula, and that the latter is at the above-said distance, then the light of that star, to be visible to us at all, must have been three million times that of our sun. But it faded so quickly as to make that unlikely. Therefore the nebula is not at the above-said distance.

The thread is obviously exceedingly thin; but astronomers are as well aware of that as we. STUDENT

The Source of Mind

SLOWLY science climbs in her own way out of the doctrine of mechanism. That doctrine stands midway between the doctrine of the continual interference of a personal God, and another not yet formulated. It might be as well to let it stay awhile partly unformulated that a brood of dogmas may not be born again.

The naturalist, John Burroughs, has been looking at the vast ladder of evolution, from the atom to man, finding mechanism, or rather the mechanical theory, inadequate.

From the finite or human point of view we feel compelled to say, some vaster being or intelligence must have had the thought of all these things from the beginning or before the beginning. It is quite impossible for me to believe that fortuitous variation—variation all around the circle—could have resulted in the evolution of man. There must have been a predetermined tendency to variation in certain directions. No more would the waters of the interior of the continents find their way to the sea were there not a slant in that direction, than could haphazard variation, though checked and controlled by natural selection, result in the production of the race of man.

A heap of iron filings kept in slight motion, towards which a magnet is slowly approached, begins little by little to show signs of organization. As soon as the magnet is near enough they are found in regular lines corresponding to the invisible lines of force about the magnet's poles and now transmitting its force.

The analogy may not be very complete, but it holds some of the truth. It is no more true that man's soul was developed by the flow of nature than that the magnet was developed by the regulated approximation of the filings. The filings will do for the symbol of nature; nature whose eternal motion would be blind were it not for the "vaster being or intelligence," the "slant" of Mr. Burroughs; the magnet, for the collectivity of divine souls that will become divine-human by their contact with their groups of "filings," by their incarnations. Evolution is a double process, an upcoming under the influence of what is downcoming to meet it; matter preparing for the souls and always in the field of their light. Each of us will find himself to be one of those souls when he has found himself, disentangled

himself in consciousness from the threads so closely about him. Not until then can he form any real conception of that all-consciousness of which he is a manifestation, the form of being so crudely *manned* by the churches.

The soul or intelligence of matter is the field of the light of the souls, the field of the magnet with its countless intelligently directive lines. Variations are the approximations to the lay of the lines, and because of the lines the variations are not fortuitous. Mind is the result of their increasing approximation, not appearing at any given point or degree of complexity, but present in simpler and simpler forms from the very first. Only if we arbitrarily apply that term at some given point are the words of Dr. Jenkinson true:

Mind is not matter, not even living matter; rather it is the new quality constituted by an increase in the complexity of living matter, immaterial and as distinct from that matter as is "blueness" from vibration of a certain wave-length. Dependent on and inseparable from matter, however, it is; when that matter, whether in the individual or in the race, attains a certain degree of complexity, then and then only does mind appear; and with the disappearance of that complexity it perishes. (*Experimental Biology*)

It does not perish; integrating and disintegrating again and again, but always getting closer to the line at the successive integrations, particular groups cease to manifest *particular degrees* of it with the ceasing of their grouping, and then at re-grouping manifest it again. STUDENT

The Dilemma of Color

ZOOLOGY seems to be finding considerable difficulty in the coloration of male birds. The rule is of course, that at the mating season more or less gorgeous apparels are donned to be shown off to the supposedly admiring females. These, also supposedly, select for their mates the owners of the most gorgeousness. The offspring of each year, having always the most ornate birds as their fathers, grow themselves more and more ornate.

But, as more than one geologist has shown, certain birds of perfectly quiet habit in dress, the British warbler for instance, donning nothing particular at the mating season, nevertheless go through all the antics which in the case of other birds are supposed to be for the display of their plumage-colors. The hypothetical aesthetic selection on the part of the females evidently does not obtain in these cases; and since not, what warrant is there for supposing it to be the cause of the evolution of color in *any* case? Besides, minute acquisitions never are banked up in the way the theory requires.

Moreover, *natural* selection would work directly against sexual selection. For any accession of color would render the bird more conspicuous to its enemies, and, theoretically, should have ceased to occur before it had well begun. But there is color and plenty of it. Zoology is not entitled to contradictory explanations for contrasting facts. Why does not one sort of selection always produce color or the other always prevent it? STUDENT

Man as a Creator in Nature

THERE can be no doubt that the science of breeding plants and domestic animals, and thus producing modifications and new forms in them, is a very old science and has always been familiar to mankind in periods of culture. In our age we are the lucky heirs of extensive work of this kind, accomplished we know not when or by whom, which has provided us with a number of useful fruits and domestic animals distinct from their wild analogs. Since these forms do not produce themselves, and the theory that they were specially created by a beneficent creator for the use of man is out of court, it is convenient to fall back on the hypothesis that they were produced by man himself (as one of agents of creation) in bygone times of scientific skill. And he may do the same today; in fact he is already doing it, and trumpets his latest achievements in the art as something entirely novel; though one opines that he is really only in the way of re-discovering some of the forgotten knowledge.

Of course we know that plants and animals can be modified by modifying their external conditions of life; wild plants can be made to grow richer by taking care of them in a garden, and animals can be tamed and improved by breeding. This is common knowledge. But experimenters claim to have lately discovered other ways of modifying plants and animals. These other ways likewise consist in modifying the circumstances. In this case, however, the circumstances modified are not so external as in the former case; and science seems to have made an invalid distinction between these two methods by speaking of the newer one as being a modification of the internal powers of the organism. Thus we find scientists saying that it has now been found that alteration is produced, not by modifying the external conditions, but by altering the power of the organism to respond to such external conditions. This is a distinction of degree, perhaps, but not of kind. The cross-fertilization, chemical treatment, and other similar ways of affecting the plant, are alterations of external circumstances, just as are the providing of new soil and manure; only they are not quite so external.

The bacillus known as *Micrococcus prodigiosus*, or "bleeding host," occurs in woodland streams in autumn. On bread it produces red spots, from which the popular name is derived. It will produce these red stains on potato; but, if the culture is heated to blood-heat, the bacterium is transferred into another species with different properties and the formation of the blood-color is stopped, re-commencing, however, when the temperature is lowered below blood-heat. Varieties of butterflies have been produced in temperate climes, which are found only in polar or tropical regions, or nowhere on earth at the present time. This is done by regulating the temperatures under which the pupae are kept. New artificial varieties of

Lomaland Photo. and Engraving Dept.

HILL AND FORTRESS OF MONTJUICH, BARCELONA; WEST OF HARBOR, S. W. OF CITY

lichens can be produced by "symbiotic associations of algae and fungi," lichens having been found to consist of a combination of the tissues characteristic of algae and of fungi. Different kinds of yeast can be produced, and thereby different kinds of wine and beer made.

It is claimed that these things are done, not by selection, but by transformation of qualities; not by changing the external conditions, but by altering the qualities of the organism—a distinction to which it is not easy to attach a significant meaning. In all cases, man modifies some conditions, and the organism responds to his treatment. And, whether his treatment is chemical, thermal, produced by manipulation of the pollen, or what not, it is still a changing of conditions. The living soul of the plant or animal, which does the responding, lies beyond the ken of the experimenter; but to the reflecting student will occur the thought that it may be possible to influence this soul more directly, through channels not physical but interior, when man shall understand more about the nature of his own soul, that of the souls of the plants, and the relation between the two. It is more than probable that such interaction between man and his plants and animals does actually take place, though not understandingly; for everyone is aware of the difference in results obtained by different gardeners and breeders and often attributed to some mysterious power of sympathy. And when knowledge aids this unconscious influence, its effects will be greater and more certain. We shall be able to know the plant as a soul, as a living consciousness, and to treat it accordingly. But such knowledge, and the power to wield it

aright, imply the attainment of a mastery of our own nature such as we do not yet possess. It is encouraging, though, to ponder on these inklings of the possibilities that await mankind when the progress of the true science of life shall have removed from man's path the many obstructions to knowledge. STUDENT

Oregon Caves Nationalized

IN July the President signed a proclamation making a National Monument of the Oregon Caves or "Marble Halls" of Josephine County, in southern Oregon. These are in the Siskiyou National Forest.

The caves are in marble and other limestones, and consist of innumerable caverns, corridors, and passages, decorated beyond description in crystallized carbonates. They have been explored to a distance of two miles or more, but much has not been explored and the extent is unknown. There are two caves, one about 2000 feet below the summit of Cave Mountain, the other some 700 or 800 feet higher. They were discovered in 1874. It is believed that the entire mountain-side for five or six miles is honeycombed, and streams can be heard running in bottomless pits. The lime deposits form massive pillars, delicate stalactites of alabaster whiteness, with the crystal drop adding its tiny increment hour by hour, day by day, age by age, and broad sheets like drapery with graceful waves that must have been made by wind-currents, set in motion by the streams.

In past years the ubiquitous visitor has begun the process of transferring the caves piecemeal to his magpie's nest of curios; so the Forest Service has urged that they be made a National Monument. T.

Death as One of the Crowning Victories of Human Life

A Lecture given at Isis Theater, San Diego,
September 5, 1909

IT may sound strangely that death, which looks so like defeat, utter defeat of the attempt to live, should be spoken of as a victory.

The body has indeed been routed, and the army of living things that compose it is about to be scattered to earth and air.

The soul, *in* the body, may indeed be confused for a little while in the dissolution of its tenement. It has shared and filled full the life of the body, making that life its own life and the feelings of the body its own feelings; it has thought with the brain and felt with the heart and acted with the hands and feet. And so, when the elements of all these are beginning to loosen their unity, it may feel that it too is dissolving and may presently be no more, neither to think nor to feel nor to act any more.

But ere many moments it will come to itself, recognizing that it was always *itself* that made the heart feel when the feeling was noble, that *itself* thought into the brain the thoughts that were pure, that it was itself in all fine action the guide of the hands and feet.

And it occupies the very moments of actual death, which are moments when it seems to us bystanders that death has already come and done its work, in collecting into itself the memories of all the feelings with which it inspired the heart, all the thoughts with which it inspired the brain, all the deeds which it did with hands and feet. There were lower feelings that came not from it but from the body itself; there were thoughts and deeds that came from the animal and selfish nature. From all *these* it now frees itself, leaving them and their memories with the body that gave them origin and birth. It is *free* with itself and its own, rejoicing in its own divine nature, the nature it had pure at the radiant morning of time ere ever there were flesh and the sins that flesh was to prompt. It was then divine; it is now more than that, divine-*human* with a thousand human memories.

Death is its victory, foretaste of a greater victory to come hereafter for us all, greater because then the sinning nature of flesh will not have been merely shaken away until the hour strikes for another birth, but *during the course of some lifetime* redeemed and transformed.

If we could look deep enough into our own minds we should find that our deaths, the deaths that closed our lifetimes that have passed, deaths that were freedom regained, are not wholly forgotten. Their memory lives, and has preserved deep, deep in our thought, the dim ideal of freedom. To merciful death and its experiences we owe our power to con-

ceive our own divinity, our *divine* humanness. If we have lived many times before, we have died as many. If we shall live other lives, we shall die their deaths. At last in some one of those lives — which we *could* make this one — we shall find that we have accomplished the great and final victory, transcending death and winning for ourselves more than ever deaths could give. Nothing in mind or body will remain with the very possibility of an unworthy feeling, thought, or deed. We shall have joined those who have no more fighting to do for themselves and may now with wholly freed hands fight for the world.

So our deaths are the successive steps of the soul's triumphs on the way to the great triumph of all. Nature, whose intent is beneficent to make us from purely divine, divine-human, flows in around the soul as it takes up each new life, partly or wholly overwhelming its light to shine free once more, once more at one with the supreme and never-clouded light of the world-soul. Death is part of her program to show us what we are. If we think of it in that way, finally realizing it in that way, we shall learn its lessons when it comes, a thousandfold better, and forget no more.

Every noble and unselfish deed or feeling is a triumph and a death of an unworthy element. It is a triumph over the selfishness and passions and fears of the life of flesh. All these passions and fears seem sometimes to gather together at the hour of what we call death for a final effort to seize the soul and carry it down and away with them. And then that old warrior ever youthful, often defeated yet never defeated, often forgetting his divinity yet ever remembering it in the end, collects himself in the surging storm of memories, sees himself as he is, and arranges and refreshes his forces for the next combat, the combat that opens with every birth. Death is again and again defeated ere his last defeat. The light of the soul ever burns up at death, even when life has seemed to have utterly extinguished it. Let him who fails and fails, who seems to himself to be weighted with passions he cannot lighten or resist, but who yearns to do so, remember this. His very yearning is the mark and warrant that he as soul still is, will know himself at death, and has in store for himself at some time the great triumph.

All the enemies of the soul are in the body it inhabits, the passionate demands of the functions of the body for over-use and misuse. It is they which in life delude the soul, seize some of its creative power and thus become the parents of hates, vanity, ambition, selfishness, greed. These are enemies; these the soul's entanglers; these blind the soul to itself. It is these that bring on death, and yet by the very death which they make necessary, conduce to their own last destruction. For it is by death that the soul sees what they are, how it was deluded by them and how at its next birth it may deal with them a little better, be less deluded, and perchance even destroy them forever. And we may make this forgetfulness ever less and less, may even now in this life, if we will, gain in the silence of aspiration and meditation all that death will give.

As old age comes on, and its failings and perhaps diseases begin, this pull of the body upon the soul may grow greater. The body may take the soul for its own. "Soul," it says, "thou hast for long years rejoiced with

me in my health and my pleasures, calling them thy health and thy pleasures. Now that they are going, some, and gone, some, and that the ashes of the fires alone remain, thou shalt sorrow with my pains and my weakness. Nay, more, thou shalt die with my death." And then its clutch upon the soul may grow frantic and desperate.

The charge is true for most of us. As Plato said:

"Every pleasure and every pain is as it were a nail which nails and clamps the soul to the body, and fashions her in the image of the body, causing her to believe that to be true which the body affirms to be true, and from agreeing with the body and rejoicing in what appertains thereto, she must perforce, I think, end by acquiring a like nature and habits."

Not unless the demands of the body pass a certain point and run over into some fatal indulgence, not until the soul finds itself the victim of some such demon as drink or morphine, does it ordinarily feel its chains. The bondage of life is not known to most of us until we try to break from it, to tear out some thread of base habit that has woven itself into the soul's garment of flesh.

This is because to most of us the word soul means almost nothing. We do not think of it as *self*, as I; it is something pious that somehow belongs to Sunday and is somehow connected with sin.

Yet it is I itself, self itself, and in itself free from all soil, all clay. Death happens only to the soils, the clays, whether to them all in the event we specially call death, or to some one of them when a man shakes himself free of a vice or a weakness. All deaths help to free the soul and make it more. Is he less a self, less himself, who, once hating, once ambitious, finds that hate and ambition have died away from him? Is he less self, or more, in whom the stain and crave of drunkenness has vanished? Is one less self, less living, or more living, when, listening to music, he passes up beyond the reach of appetite, even beyond recognition of the very room in which he sits? Something dies away every time we triumph over a base appetite, every time that selfishness is laid aside in compassionate action; are we any *less* for these deaths of darkness? Are we not *more*? The hero in the hour of supreme appeal rises above all the selfishness, all the desires that make up the life of most men; and though he has lost all this, though he has lost all thought of self, is yet more superbly self, more consciously alive, than ever. Should he die in that hour, he dies into an ampler freedom. He passes to that more living, more luminous world to which ascend all human aspirations, from which descend all human inspirations, the proper world and home of soul from which if we were cut away for one moment we should go mad with despair and fear. For in that world are rooted those subconscious hopes and faiths of ours that save the worst of us from a deeper plunge, the most despairing from utter night. In that world rest the souls of men whom death has freed and whose every aspiration, there unclouded, there unstained, is felt by us on earth.

Yet even we on earth are also there; we live in both. The oscillation of our lives, to and fro, between flesh and light, is incessant second by second. We flash for a fleeting instant into light, and then again are flesh. For

long ages we have turned our attention so fixedly upon things of sense that we have almost lost the power of noting the fleeting flash into light. Yet it still occurs. We have but to learn to stand still sometimes in the silence, and we shall find and may hold those flashes and make them part of our conscious life. Death is their victory, their continuity.

Can we not now find the secret of those who have conquered fear of death? Every-one of us can conquer it for himself in finding himself.

Men of science are seeking for proof of immortality in the study of the chatter of the spook-world, thinking that may be the world of light. But the spook is but the sediment thrown out of the broken retort after the great alchemist death has done his distilling.

We can find proof of immortality only by finding in ourselves, as self, that which is immortal in its very nature. He who would do this, who would do for himself in life that which Death will do for him in death, must go every day at some time into the silence of his inner nature, in the spirit of one who seeks a sacred benediction. It will come. Little by little the soul will awake to itself and know. It will understand what lives and what dies, what death removes and what it makes free. If effort be constant it will at last, at some moment of some day, find that it has won in life that divine and perfect freedom that death gives, all the joy, all the compassion, all the boundless sympathy for and understanding of human hearts and of the life of whatever else lives. It has been written that for those who are faithful enough and constant enough to pass death while life still endures, life becomes a possession so wholly new, so vast, leading so far into the stretches of endless light, that any present imagining of ours must fold its futile wings. Death is great and gives much; but life is greater. Death is victory; but from life a greater victory may be won.

HERBERT CORYN, M. D., M. R. C. S.

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question It is said in some Theosophical writings, that we should "kill out ambition," and "kill out desire." Are there not then, noble ambitions? Are there not worthy desires?

Answer Perhaps; and if so, it is not to them that the injunctions quoted refer. But we are apt to be so mightily tolerant of our own weaknesses, and practise such overflowing charity towards them, honoring much for virtue that had better be constrained for vice, that the statement cannot be called too sweeping. A noble ambition is rather like righteous anger or black whiteness or hot ice; one might as well call it by another name. One might as well call it aspiration, or something of that sort, at least when going about to define and inquire into it; and leave the other term for a passion tainted with selfishness. The world calls that ambition noble which is not actually sordid or base; as the desire for place or power when there is no intention to use them for self enrichment or gratification. But it does not count fame and laudation in the same dishonorable category with money or luxury. Yet one can gratify self with the sound of one's name in the mouth of the multitude, or with power over one's fellows, in a manner dangerous and affronting

to the soul; as well as with mere food or drink.

To be ambitious for humanity, and long after the advancement of the whole race, is another matter; and this only Theosophy commends or would term noble. Not only noble, either; but necessary; a man cannot be rightly virtuous, that is, manlike, who is not possessed with such a longing. You say that without ambition for motive force, the work of the world would not be accomplished, and all things would be brought to stagnation and somnolence? But this is not so; for this

FROM

OUR LADY OF THE SNOWS

O, to be up and doing, O
Unfearing and unshamed to go
In all the uproar and the press
About my human business!
My undissuaded heart I hear
Whisper courage in my ear.
With voiceless calls, the ancient earth
Summons me to a daily birth.

Forth from the casemate, on the plain
Where honour has the world to gain,
Pour forth and bravely do your part,
O knights of the unshielded heart!
Forth and forever forward!—out
From prudent turret and redoubt,
And in the mellay charge amain,
To fall, but yet to rise again!
Captive? ah, still, to honour bright,
A captive soldier of the right!
Or free and fighting, good with ill?
Unconquering, but unconquered still!

For still the Lord is Lord of might;
In deeds, in deeds He takes delight;
The plow, the spear, the laden barks,
The field, the founded city, marks;
He marks the smiler of the streets,
The singer upon garden seats;
He sees the climber in the rocks;
To Him the shepherd folds his flocks.
For those He loves that underprop
With daily virtues heaven's top,
And bear the falling sky with ease,
Unfrowning caryatides.

Robert Louis Stevenson

higher motive is a far more powerful impulsion; and he who is filled with it, is capable of grander work.

The truth is, that right and wrong, for us human beings, are distinguishable at last only by this criterion: wrong is that which confirms us in selfhood; right that which draws us out into largeness and universal life. So one may desire to stand in some magnificent position as benefactor and doer of good, and be only crippling his own soul by the longing; he is crippling it, that is to say, if his aim is tainted with the wish for reputation, or even to increase his own capital spiritually.

The goal Theosophy points to, is one to be attained by giving away and dispensing with oneself; and one shall resolutely seek out the utmost interior poverty, and to be beggared, not merely of possessions, but of one to possess them. All that usurping and unwearied councillor called "I" is to be known and disvalued for a traitor; it is no fair blossom, but a weed and parasite on time. This is the meaning of "Blessed are the poor in spirit," which does not refer to the unmanly or weak, but to them that are devoid of self, and possessionless as regards personal desires and

ambitions. Albeit the result of such impoverishment is riches inconceivable, and to be dowered with the universe and all life. It is to become co-worker with aeonian harmonies.

Desire is a divine principle, and has its indispensable place. It is as necessary that we should have experienced it, as that we should have experienced anything there is of good, or as that we should be experiencing now the effort and power to control and overmaster it. The whole animal kingdom is a universal provision, that the Spirit, circling down through the worlds of evolution, should have place to dwell in and become fully acquainted with desire. Therein was a new principle added to its being, to give fresh impetus to its growth through worlds human and superhuman. In ages past we too were in the animal world, and learned how to desire, and brought that knowledge with us into our present state. But here we found a new duty awaiting us; to transcend that which we had been formerly; and make desire, not a guiding star and reckless leader, but a submissive ministrant and motor of progress.

The animal is conscious of desire, and goes with it whither it leads him; but knows nothing of the subtleties of self-consciousness. He mixes no mentality with the flame that carries him along, does not scheme to increase desire and gratification, knows nothing of sin or selfishness, but goes with his desires as nature intends him. He welds it into his being as a great motive force, which will not leave him afterwards in the whole course of his evolution. That is to say, that the spirit of evolving monad has gained this new thing in the animal kingdom; not the objects or incitements of desire, but its pure flame and essence are its eternal gain.

For we must separate desire as we know it, into two parts: itself, a clean urge forward and ensurer of perpetual motion; and its casual objectives or the matterward tendency that may have been inspired into it. We brought forward desire from the animal world, and might have simply marched forward on its impetus to the heights of humanity, but that what we brought forward was still laden with the heaviness of animality, and had to be refined by contact with the divine mind incarnate in us.

That is what is before us to do. In place of lifting desire into its proper human station, we have allied our minds with its animality, swelled our selfhood by means of its energy, and gone to work with intellect to devise it new fields for gratification. We have it in our power to use it for a grand energy in our godhood, making it the wheels and steam of compassion. What we have done is to tutor it with intellect, and make for ourselves a demon of it to battle and counteract our proper divinity.

The hero fought with the dragon for seven days, and in the end his vanquished adversary turned into a god to befriend and protect him. We find in our own nature immense forces to be overcome; but every stroke that we deal in the battle is for added strength to ourselves. Desire, in the passage quoted, stands not for the divine, unimpurified energetic principle; but for the intellectualized animality that feeds and hedges round our lower selfhood, and so perpetually prevents our seeing ourselves as embodiments of the universal soul, and agents of eternal Law. THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l O f f i c e P o i n t L o m a C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

What is a Religion Founded on Nature's Laws?

"RELIGION of the Future — No Reliance will be Placed on Anything but Nature's Laws," is a newspaper caption that strikes the eye and at once suggests the query — "What are Nature's Laws?"

Who is Nature? He is our alternative God, evidently, or perhaps one should say Goddess. In the Occidental religion of the future this deity and its laws are to replace the older-fashioned god and his laws. Down steps Jehovah; Nature ascends, and it is no loss. It is a revolution, the beginning of a new dynasty in Olympus.

What the professor means is that we shall rely on what really exists and happens, instead of on what authorities say exists and happens. He wishes to say that we shall know the truth about things, instead of accepting dogmatic assertions. By "Nature's laws" he evidently means the truth, as opposed to mere dogmatic belief.

But the phrase, "Nature's laws," is commonly used in a restricted sense. It is considered as having reference to natural science; and as natural science is restricted to the outer or phenomenal world, it is inferred that the laws of this outer world are to be imposed on our inner life and exalted into rules of conduct. In short, the use of the phrase, "Nature's laws," suggests an attitude of scientific agnosticism or of materialistic negation.

To avoid this it is necessary to discriminate between Nature's actual laws and our own imperfect or erroneous conceptions of them. For we may fancy we discern laws which do not really exist. And again we must discriminate between the various kingdoms of nature, such as the human, the animal, the vegetable.

The word "Nature," as generally used, is a vague expression for the spirit and life and consciousness that animates the various organic kingdoms — the mineral, the vegetable, the animal. To worship this spirit would be a return to "nature-worship," naturalism. But there is a higher Nature; the word "Nature" may be regarded as including the spirit and life and consciousness that animates and en-souls the whole universe: universal Omnipotence and Omniscience, "God"; in man, the voice of conscience. In this case, obeying Nature's laws would mean obeying the highest promptings of intuition, the Divine Law.

For Nature does not reveal herself through

MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

in an understanding of the laws that determine human happiness and welfare. And these laws are first and foremost *moral* laws — a morality based on the actual facts concerning the spiritual nature of man.

In fact, we are getting away from religionism in order to find Religion. Jesus upbraided the churches of his day because they

shut up the "kingdom of heaven" against man, and would neither enter it themselves nor suffer anyone that was going in, to enter it. So the churches of our day have shut us out from true knowledge. They ought to have taught us Nature's laws — not only those that modern science studies, but the laws of our spiritual nature above all.

The greatest of these laws is human solidarity — the fact that human beings are not separate but united as to their essential nature. Selfishness tries to ignore and defy this law. The churches have not emphasized the fact of our solidarity, but have centered our attention on our own personal salvation. But we are rapidly learning that the interest of all is the interest of each.

A religion founded on a knowledge of the laws of human nature, spiritual as well as physical, would have a solid foundation.

STUDENT

Explorations in Crete

ACCORDING to the *National Geographic Magazine* the results of ten years' excavation work have been remarkable. The palace of Knossos alone is said to consist of a more complex and extensive series of courts, rooms, and labyrinthine passages than has been met with anywhere on Greek soil. Further, the investigations show that this era dated back to 3500 B. C.; that a high degree of artistic skill in decorative art and modeling had been attained; that out of the hardest stone graceful vases were cut; that jewelry no less beautiful than that of the Alexandrine period was made; that boats plied frequently to and from Egypt; that men lived in houses two and three stories high, equipped with baths and drains and well-lighted rooms opening into sunny courts. In the fresco of the Cupbearer, and the portrait of a Mycenaean youth, the colors were almost as brilliant as when laid down. One wonders how all this could have been achieved only 500 years after the creation of the world!

the senses only; that which is thus revealed is only her external aspect. To sense Nature's inner laws we need to use higher faculties. We need to develop our Understanding. It is essential, therefore, that there should be people capable of recognizing Nature's laws, otherwise how can they follow them?

Our present knowledge of Nature is far too incomplete to be relied upon; so this future religion implies a greater knowledge. And that knowledge must not be confined solely to a larger acquaintance with electricity and x-rays and flying machines, but must consist

THE THEOSOPHICAL ADDRESS AT ISIS THEATER

THE meeting last night at Isis Theater proved to be one of the most interesting ever held, the audience listening with the closest attention to Kenneth Morris' interpretation of some of the old Welsh legends. Mr. Morris has for some years been a resident at the International Headquarters at Point Loma, under the direction of Katherine Tingley, Head of the Theosophical Movement throughout the world.

At the close of the meeting a telegram was read which had just been received from Katherine Tingley from Newburyport, Mass., stating that information had been cabled her of a terrific cyclone at Pinar del Rio in Cuba. Miss Lester, directress of the Rāja Yoga Academy at Pinar del Rio, cabled that thousands had been rendered homeless. Mrs. Tingley asked that appeal be made to the audience at Isis Theater and to the public for contributions in aid of the sufferers. She herself headed the list with \$200. This appeal was made in pursuance of one of the objects of the International Brotherhood League, founded by her in 1897.

From Kenneth Morris' address we quote the following:

"You can come at the truth in either of two ways: by a road of thought, when the record of your truth will be in the form of what we call philosophy; or by a road of imagination and feeling, when its record will be what we call poetry, in the highest and most inclusive meaning of the term. For the most part, the ancient races, when they were aglow with life and vigor, and found the world teeming with noble deeds for them to do, wrote down their ancestral Theosophy in this imaginative form rather than in terms of thought and philosophical statements of law. They had very good reason for doing this. Poetry publishes the eternal verities in the language of action, and proclaims the highest wisdom as if it were not merely thought about, but actually seen; and for that reason it takes hold of a deeper sense and memory than do philosophy or ethics as such. Of course, they had these latter too; but they, and especially the philosophy, were taught mainly in the schools of the bards and priests. In Welsh literature, for example, there is a splendid record of philosophy; but whereas the existence of this is still practically known of only by a few scholars, all the world has heard of the Arthurian legend. . . .

"They were not writing, those Bards, after the fashion of the modern novelist; their wonderful and beautiful tale is simply a myth or allegory of the soul; and shows, to all who can understand, the relation between these bodies of ours and our minds and our souls, and that eternal, unseen spirit which we sometimes call God, the Supreme Self of the universe. All the lofty and mystical incidents were to be taken as glyphs or symbols of facts in the story of human evolution; and because this is so, these stories, though so old, are eternally new and fresh, and always worthy of study. They were the scientific text-books of the ancients; and if we compare them with our modern text-books we shall not find them wanting. From anatomy and physiology and biology we can learn a deal about our bodies, but nothing about our very selves; they classify external facts and appearances, but say nothing of the internal and real causes; they are couched in the language of intellect, and do not at all rouse or inspire the imagination. But the text-books of the ancients speak to the soul and set the imagination flaming; they deal with the world of causes, and picture the man himself, not the mere envelope of flesh that he wears; they seize hold upon and uplift our consciousness, and do not merely fill our minds with endless classifications of details. Not that one would wish to disparage modern learning; it has its own useful and splendid place; but we ought not to set it up as the be-all and end-all of acquirement; we ought to remember that wisdom is higher than learning, and that it was wisdom that the ancients recorded, and that therefore we have a very great deal indeed to learn from them."—San Diego Union

Mr. Morris will give two other addresses on the same subject, "Theosophy in the Welsh Legends," and while in this report it is possible only to give a brief extract, the whole may be published later. OBSERVER

The Gaelic Language Movement---IV

THE immense antiquity of the human race, which is beginning to dawn as a fact in the minds of palaeontologists, renders the tracing of the origins of languages a fascinating study. But philologists have been hampered by those wholly inadequate ideas of human chronology, and of world history, which have prevailed in the West for many centuries. The Eastern world, with its absolutely stupendous chronology, has only recently, comparatively speaking, become known to the West. And the West has nevertheless been gathering facts which, on the evolution hypothesis alone, demand an antiquity for man of many millions of years; so that the West ought now to be prepared to grapple with facts in a new way.

The following quotation from *The Secret Doctrine*, Vol. II, throws a sidelight not only upon the origins of the Gaelic tongue, but also on the antiquity of man:

It is well known that Antiquity has never claimed palaeontology and palaeontology among its arts and sciences; and it never had its Cuviers. Yet on Babylonian tiles, and especially in old Chinese and Japanese drawings, in the oldest Pagodas and monuments, and in the Imperial Library at Peking, many a traveler has seen and recognized perfect representations of Plesiosaurs and Pterodactyls in the multiform Chinese dragons. We read in the *Mémoire à l'Académie* of the "naive astonishment of Geoffroy St. Hilaire when M. de Paravey showed to him in some old Chinese works and Babylonian tiles dragons, . . . saurians and ornithorhynchuses (aquatic animals found only in Australia), etc., extinct animals that he had thought unknown on earth . . . till his own day." Moreover, the prophets speak in the Bible of the flying fiery serpents, — *Isaiah*, xxx, 6: "The viper and the flying serpent unto the land of trouble and anguish," and the fiery serpents conquered by the brazen serpent of Moses. . . . Now the following questions are put very directly:

1. How could the ancient nations know anything of the extinct monsters of the carboniferous and Mesozoic times, and even represent and describe them orally and pictorially, unless they had either seen those monsters themselves or possessed descriptions of them in their traditions, which descriptions necessitate living and intelligent eye-witnesses?

II. And if such eye-witnesses are once admitted (unless retrospective clairvoyance is granted), how can humanity and the first palaeolithic men be no earlier than about the middle of the tertiary period? We must bear in mind that most of the men of science will not allow man to have appeared before the Quaternary period, and thus shut him out completely from the Cenozoic times. Here we have extinct species of animals, which disappeared from the face of the Earth millions of years ago, described by, and known to, nations whose civilization, it is said, could hardly have begun a few thousand years ago. How is this? Evidently either the Mesozoic time has to be made to overlap the Quaternary period, or man must be made the contemporary of the Pterodactyl and the Plesiosaurus.

. . . and Job mentions the Leviathan. The fossils reconstructed by science, which we know ought to be sufficient warrant for the possibility of even a *Leviathan*, let alone *Isaiah's* flying serpents, or *saraph mehophep*, which words are translated in all the Hebrew Dictionaries as "saraph," enflamed or fiery venom, and "mehophep," flying. But, although Christian theology has always connected both (*Leviathan* and *saraph mehophep*) with the devil, the expressions are metaphorical and have nought to do with the "evil one." But the word *Drakon* [dragon] has become a synonym for the latter. In Bretagne the word *Drouk* now signifies "devil," whence, as we are told, by Cambry (*Monuments Celtiques*), the devil's tomb in England, *Draghedanum sepulchrum*. In Languadoc the meteoric fires and *will-o'-the-wisps* are called *Dragg*, and in Bretagne *Dreag*, *Wraie*, or *wraith*; the castle of Drogheda in Ireland meaning the devil's castle. (pp. 205-206)

Needless to say, it means the castle of the Dragon; but needful to say, as Dragon was

the ancient glyph, equally with Serpent, for one initiated into the mysteries of life and death, the real meaning of the castle of Drogheda would be "the home of an Initiate." Curious, that this title should belong to a place so near Brugh na Boinne — and significant. Still more significant, that its change of title should so admirably harmonize with the course of nescience and bigotry in the West, since Hypatia was murdered and the Mysteries of Eleusis withdrawn, when everything of the glory and magic of a limitless past was proclaimed the work of the devil by those who quietly adopted the rites, vestments, and ceremonies of their betters in ages gone, without having more than a spark of their real knowledge.

The Irish script, a beautiful character, suggests its derivation from the Phoenicians, who were in turn instructed by the Chaldaeans, a race which long ante-dated the Semitic, who began their existence as a family race only about eight thousand years ago. The Chaldaeans, whose veiled outlines of theogony and history formed the basis of later European systems, were in turn instructed by the Akkadians, who were emigrants from northern India. The roots of these languages was pre-Vedic, so to say, and pre-Sanskrit, in a sense. It is a direct line of descent from the latest races of Atlantean times.

Another line of descent which reached northern Europe and Ireland was referred to in a previous article, the dolmen-builders, of the second sub-race; ours being the fifth, in a period covering, from the first, some eight hundred thousand years after Atlantis was submerged. These came from Egypt. They were tall, but not so tall as the Pelasgians, of whose presence in Ireland there appear to be no traces. These were pupils of the titan Cyclops, veritable survivors of earlier Atlantean times.

But on the other hand, in Ireland we have evidences of direct descent from Atlantean sources, both in some archaic markings, and in some of the traditions, which point unmistakably to the presence of the Cyclops at one period. IRISH STUDENT

Is Man a Machine?

WHILE the present trend of scientific thought is toward accepting *mind* as a starting-point for reasoning and deriving the *phenomena* of nature from it, one sometimes comes across a recrudescence of the bygone attempts to explain mind as a *result* of the phenomena instead of as their *cause*.

It is reported that a man of science at a Geneva congress on psychology, contended for the view that "what is now called spirit, soul, freedom, or will, is absolutely dominated by mechanics and chemistry." He said that the reason why plants turn to the light is that the rays exert an action on the stalk, causing it to twist; and that there is a similar chemico-physical explanation for all the actions of plants, and even for the animals — nay, even, as one gathers, for man himself.

This kind of generalization is easier to make than to verify; which may account for the way it recommends itself to some minds. What could be simpler than to announce the theory, to provide an appropriate explanation for some few cases, and then to assume that all other cases can be explained in a similar

way? But it is just as easy to mention a few cases in which such an explanation would be very difficult, to say the least. When a plant sends out a long root to tap a distant supply of water, how do the chemical and physical forces work in this case? When a creeper leans over towards a support, how is this explained mechanically? It is still more difficult to find a mechanical formulation of the acts of an animal. Suppose, for instance, a dog is taught not to visit the garbage can, what is the dynamical explanation of this?

That a part, even a large part, of man's mind is influenced by his body cannot be denied. Equally undeniable is it that a large part of his mind is not so influenced. Psychologists often seem to be unaware of the existence of any distinction between these two factors in man's consciousness—the *psychic* nature, which is influenced by the bodily cells and centers; and the *noetic* nature, which is beyond all such influence. It is the existence of the *Nous* or Higher Mind in man that enables him to act in opposition to the impulses arising from his animal nature. Were it not for this, man would indeed be an animal, destined to repeat instinctual acts and unable to originate anything—not even a psychological theory.

In "Psychic and Noetic Action," *Studies in Occultism*, No. III, H. P. Blavatsky defines the difference between these two, and quotes Professor G. T. Ladd in support of her contention that the higher functions of the human mind cannot be explained on a materialistic basis. It is important that this essay should be studied, because in it H. P. Blavatsky proves that the teachings of Occultism have a demonstrable physiological basis. As many people seem to labor under the impression that materialistic physiology rests on physiological facts, while Occultism does not, it is as well they should be undeceived on this point as soon as possible.

The interaction between the emotions or feelings and the reflex mechanism of the body is not disputed; but this kind of mentality does not constitute human nature. It only constitutes the lower nature of man; and the fact that it plays so large a part in the present average human mentality is due simply to the low state of development of the average person of today. This kind of mentality is that which we have to learn how to dominate. We can dominate it by means of the Higher Mind (*Manas*, or the *Nous* of Plato). This Higher Mind does not act directly on the sympathetic nervous system; it acts on the lower mind, and so controls the body mediately. Further, we are shown in the above-mentioned essay that the whole human body, brain, nerves, and all, is dual, in correspondence with the duality of the mind. While the animal nature acts on the bodily cells, the higher influences act through the "atoms" within the cells. Thus the human mechanism is compared to a harp with two sets of strings—one of coarse catgut, the other of finest silver. The coarse gusts of passion and desire, stimulated by the organic centers of the animal nature, can only strike the catgut strings, and cannot arouse the finer cords; these latter respond only to the gentle breezes of wisdom from the Higher nature.

There is a very great deal to be learned in Occultism, even about physiology; but it can

scarcely be given out broadcast to a world that is in such a state of confusion as ours is at present. Selfishness is so rampant that the tendency is to misuse any knowledge that may be available, and thus to bring disaster instead of benefit, both to the individual and the community. Hence such teachings, with the exceptions of hints, are only given to such as may have proven themselves fit to make a proper use of them.

Those who labor to show that the human mind and soul are dependent upon the mechanism of the body, hold a brief (whether wittingly or unwittingly) for *animalism*. Others work away at man's religious nature and endeavor to persuade him to sacrifice his free will and intellectual freedom on the altar of ecclesiasticism; others, with pseudo-philosophies, forsake the fields of duty in which they won their reputation and, whether knowingly or unknowingly, undermine people's belief in the integrity of moral sanctions. Others again are propagating teachings calculated to undermine the physical stamina of the race, and doing it in the name of new and wonderful spiritual revelations.

All this it is the part of Theosophy to combat; for Theosophy is, above all things, manly and virile, and stands for freedom: physical, mental, moral, and spiritual. STUDENT

National Fluctuations

THE nations' rises and falls of birthrate present a problem never yet solved. The general birthrate tendency of a number of peoples, our own included, is downward; France's was, causing much talk of "decadence," even from those whose own nation was showing the same phenomenon—in that case the phenomenon being very otherwise interpreted!

During the last ten years France's excess of births over deaths was twice reversed by an excess of deaths over births, during the years 1900 and 1907. Putting those two years aside the birth-excess rose for the first four years, from 23 thousand reaching 83 thousand; then it fell, by 1906 getting nearly back to the first figure again. But 1908 showed a marked recovery, the excess reaching 40 thousand. The marriages are also somewhat more numerous than in any of the preceding years.

The German decline in birthrate is more marked. Taking four periods a decade apart, we find the birthrate at 41 in 1877, 38 in 1887, 37 in 1897, and 32 in 1907. The figures for 1908 are not at hand for comparison with those of France. H. C.

Rapid Transit of the Future

PROFESSOR Scherl of Berlin has described in his book *Neues Schnellbahnsystem*, a scheme of city rapid transit which he declares, and with the support of expert critics, to be quite practicable, though expensive at the outset. Briefly it might be described as an aerial railway cobweb. The lines run on concrete viaducts, raised by concrete pillars to a great height above the houses. There is a vast central station, to which passengers are raised by elevators; and from it radiate out many straight crow-flight lines to the most distant purlieus of the city. Around the environs runs a ring-line, connecting the radii; and probably there will be other rings within this, thus making a species of cobweb.

The sub-stations at frequent intervals will also be reached by lift. A double-track monorail, with gyroscopically balanced trains, will speed over the system at 125 miles in the hour, carrying passengers without either delays or detours to their destination, and causing neither noise nor vibration to the dwellers below; while the old routes will be kept sacred to freight.

This scheme was up-to-date when published, but is already falling behind the times. For while a few years ago concrete would not have been proposed, so that the scheme is up-to-date in that respect, yet no mention is made of airships; so there is no saying but that the idea may become an interesting palaeontological specimen before it can be executed; for the times are transiting even more rapidly than Professor Scherl's trains. So far the multiplication, enlarging, and quickening of means of transit in great cities has resulted mainly in the quickening, enlarging, and multiplying of the streams of people that throng to those centers. The new arteries supplied to relieve the congestion have only brought fresh torrents of blood to the congested organs. But the professor does not stop at the cities; he casts his prophetic eye over the face of the broad country and sees there other and vaster steel cobwebs, rushing the population from farm to mart and from country-seat to official residence. H.

The Light of Asia

THE London *Graphic* gives some photographs of celebrated statues of Buddhas.

First comes the recumbent Buddha at Pegu, 181 feet in length, discovered buried in the jungle when the Pegu railway was under construction. Then comes the Kyapun at Pegu, 99 feet high, built by the Cambodians about 1000 years ago, consisting of four statues seated on the four sides of a pillar and facing outwards towards the four points; it represents the four great Buddhas, Kankathan, Gaunnaghon, Karhapa, and Gautama. Next, the Gautama in Majori monastery near Rangoon, of similar colossal proportions.

These at all events show the skill of the races that fashioned them; for statues of this size are not common even in our enlightened civilization. The page of pictures is headed, "The Light of Asia: Some Buddhas in Burma: The Cult and Creation of an Image." The last phrase strikes one as being in the nature of an apology to Christendom; only an image, after all. The difference between Buddhists and Christians is, presumably, that the Buddhists worship images while the Christians worship the deity represented by images. "The heathen [which one?] in his blindness bows down to wood and stone." To carry through the streets a little dressed-up image of the Madonna; to wage fierce wars, leading almost to blows, over some article of ecclesiastical furniture, such as an altar cloth or a button—this is not idolatry. The Christians are not idolaters because the images which they use are Christian images and consequently not idolatrous.

It is interesting to note how Edwin Arnold's phrase sticks. That magnificent poem of his woke the Western world. It is said that he afterwards tried to write another poem in which Jesus was represented as the light of the world; but poetic inspiration failed. T.

Art Music Literature and the Drama

The Irish or Celtic Cross

IT may surprise many persons to learn that the use of the cross as a sacred emblem was as widely diffused in the pre-Christian ages as it is today. Of late years many independent thinkers have demonstrated the enormous antiquity of the cross, and since H. P. Blavatsky revealed some of the deeper meanings in *The Secret Doctrine*, archaeologists have collected further evidences of the importance and sacredness attached to it from the earliest dawn of history. A noteworthy admission is made by the Rev. W. W. Seymour in his recent work, *The Cross, in Tradition, History, and Art*. He says:

It is well known that the leading truths of the primeval religion imparted to man by his Creator, in Paradise, may be traced through the principal pagan mythologies; and that a symbol of the fundamental article of the Christian creed and hope has been recognized as sacred in the very earliest records of antiquity. . . . This fact has been almost unnoticed. [Say rather deliberately obscured.] In every kind of relic which time has spared, it is clearly to be read.

He then quotes St. Augustine's significant and purely Theosophical remark in his *Retractions* (I, 13):

That in our times is the Christian religion . . . called according to that name, but not according to the thing itself, of which it is the name; for the thing which is now called the Christian Religion really was known to the ancients, nor was it wanting at any time from the beginning of the human race until the time when Christ came in the flesh, from whence the true religion, which had previously existed, began to be called *Christian*; and this in our days is the Christian Religion, not as having been wanting in former times, but as having in later times received this name.

Ireland possesses the largest and most richly decorated specimens of the beautiful monoliths whose shape combines the cross and the circle. The magnificent crosses at Clonmacnois and Monasterboice are the finest; the largest of the three at the latter place is 23 feet high. A peculiar coping-stone surmounting the Irish crosses is characteristic. (See fig. 1)

The combination of the cross and the circle was not invented by the Irish or any other Christian designers. It was not a merely decorative arrangement, for the two factors were universal world-symbols, dating from the time, before the "Confusion of tongues," when "the whole earth was of one lip," as *Genesis* puts it when speaking of the once universally diffused knowledge of the Mysteries, in the allegory of the Tower of Babel. We find them in the Egyptian sacred Tau (fig. 3), as the sign of spiritual life. Deities are often shown pouring the Water of Life in the forms of streams of these crosses upon the candidate for purification. The Christ monogram (fig. 6) has the same elements and was merely adopted by the early Christians from their predecessors. It occurs on the coins of Herod the Great and others, and is found in runic inscriptions in Zealand.

But we may go still farther back into the night of time and still find the cross; on the backs of the immemorially ancient statues from Easter Island in the South Pacific—a

witness to the lost continent of Lemuria—the Tau is distinctly carved. One of these statues, now in the British Museum, has a Tau which closely resembles a crucified man (fig. 4). In the Ohio valley the mysterious Mound-Builders, whose civilization perished ages before the appearance of the present Indians, constructed many cruciform mounds, one of which is almost identical with the symbols on the Easter Island statues (fig. 5).

Monoliths similar to the Celtic crosses have lately been found in India, in the Dekhan and

bling them, which are certainly pre-Christian. Some of these are cruciform, others merely have a cross carved upon the flat surface, and in others the cross does not occur at all. The style of decoration is the same, consisting of strap-work and spiral patterns; snakes, dragons, centaurs, elephants, mistletoe and other esoteric symbols are commonly found on these. In the Isle of Man there is a remarkable monolith which bears distinct evidence of the lunar cult of Isis; on its four compartments there are three cats of different degrees of plump-

6. Pre-Christian Monogram adopted by the Early Christians.

elsewhere, among ruins of lost civilizations; and in Kamschatka, Japan, Persia, and Assyria, the cross is frequently seen. In Cyprus ancient Phoenician coins are found bearing a cross and a lamb. The ancient Mexicans called the cross the Tree of Life, and several forms of it are conspicuous in the Temples of Central America. Among others, the Pagoda of Mathura in Southern India, the reputed birth-place of Krishna—whose life-story so closely resembles that of Jesus—is built in the form of a cross. This is hardly surprising when we remember that Krishna, as Wít-toba, a form of Vishnu, is represented in Hindúism as having been crucified.

While it is clear from inscriptions and from the Biblical incidents carved on the great Irish crosses mentioned above that they are of early medieval origin, there are several other monoliths in the British Isles, closely resem-

ness, and a shrew-mouse. The cats typify the lunar changes and the mouse is supposed to stand for the days of the lunar month.

In the celebrated New Grange Tumulus, on the Boyne, near Drogheda, the chambered passage is cruciform in plan, but the most conclusive proof of the use of the symbol of the cross and the circle in religion in prehistoric Britain is seen in the plan of the great Druidical Temple of Classernis, in the Island of Lewis, in the Outer Hebrides, Scotland. This is a perfect "Irish cross" (fig. 2). The wonderful Serpent Mound, which so closely resembles that of Bush Creek, Ohio, is not far from the Druid monument.

It is clear that the significance of the cross is not minimized by its widespread diffusion in ancient times. It becomes still more sacred and important, for it is seen to be not limited to any one form of religion. CASHEL

The Intuitional Woman

H. P. BLAVATSKY wrote: "Reason is the power of the man, intuition the prescience of the woman!"

The intuitional woman is a mystery. She has a certain positive knowledge that she will never explain either to herself or to any other. Out of the gold of her heart she fashions crown and scepter—and rules the world.

The world's greatest general was such a woman. Joan of Arc, without knowing why, knew always the best to do. In her poor home, at play, on battlefield, in camp, and through all persecutions, she *knew* unerringly. You cannot account for her without considering her intuitional illumination, and you cannot understand her, nor any of the inspired leaders of men, unless *your* inner knowledge enlightens your understanding. The stars do not shine for the sightless.

If her life is kitchen-bound the intuitional woman—so rare, alas!—will select and serve to her family the proportions, quality, and quantities of food that approach astonishingly near the exact requirements. How? Through long practice and observation? or through study of needs and effects? Well, if you ask her she will say: "Oh, I just know, somehow. I can't tell how, but I *know*." And results prove that she does.

It is out of her solicitude for the welfare of those whom she loves that her knowledge comes. She loves the duties that come for their sakes, and she knows much true wisdom forever hidden from the self-engrossed housewife.

The babies of the intuitional woman do not take terrifying tumbles nor eat poisonous lozenges, for the intuitional mother is a protective rather than a corrective power. She holds back from her children dangers that the other kind of woman recognizes only when actually present and demanding action. Then even the latter sometimes remembers to take the child by the heels and so dislodge the button it

swallowed while she was not on guard. But will she know what to do when more terrifying dangers confront her child later? Will she read between the lines of breeding and exterior qualities in her child's associates that fit or unfit them for companionship? Will she read her own child's tendencies honestly and fearlessly and *protectively*? The intuitional

THE WORD OF SUMMER

DROPPING roses from her hand
Came dear Summer down the land,
With her hair a tawny banner
By the breezes fanned.

And she looked and laughed at me,
Where I sat all mournfully
Counting over my lost labors,
Near a cypress tree.

And she said: "Oh, why repine?
All these patient works of mine —
Leaves and flowers and fragrant apples —
I must soon resign.

"Not one blossom will remain!
But do I, like thee, complain?
Nay, I pause and rest a season,
Then begin again."

Ella Barker
in the *Metropolitan Magazine*

woman will. *Her* love does not flicker out with the passing of her child's babyhood, for it is a lamp fed from the inexhaustible source of divine knowledge.

To think of the children, and especially these girls, the women of the future, here in Lomaland, learning Rāja Yoga, as Madame Blavatsky wished! To think of these as women knowing and loving and doing—regaining their long-lost crown of intuition, their rightful heart-wisdom! It is a vision worth the dreaming, worth the seeing. W. D.

Beneath the Surface

IN the infinite depths of human nature we can no doubt find whatever we may search for, if we but know how to search. Some eyes seem able to see only the imperfections on the surface; some see only the superficial virtues or attractions; but below all these are the noble forces of the Soul, only seen by the eyes of the Soul.

Could we but learn to use these eyes of ours by clearing away the clouds in our own personalities, what a transformed race of beings would our brothers become. And it would be not only a subjective transformation, for the searching power of the Soul would also draw forth the buried beauty. Like a mighty spiritual magnet, it would enable the imprisoned angel to burst the weaker chains which hold it, until little by little all would yield and the hour arrive when the true Warrior would stand revealed in all his majesty.

This is the noble service which each owes to all, but which no one is able to give, until with the clarion voice of the spiritual, will he has called upon the forces of his own Soul.

There are so many voices with which one may call. They may speak singly, or bring about a confusion of tongues which is bewildering. And few at this time have learned to distinguish them. Some of those from the surface have a charm, warmth, and beauty of their own, but they reach only to the surface, and so may bury still deeper the Lord of the body of our comrade.

The perception of the fine line of action belongs only to the Soul. Sentiment knows how to please, and selfishness knows how to be brutal with the faults of others; but the Soul alone knows how to hurt with kindness and love, that it may help. Sympathy is the "open Sesame," the golden key which unlocks every door. But it is essential to discriminate in using this power, for some doors would better remain locked.

Among the many voices which all hear,

some will simulate the voice of the Soul, utterly deceiving those who do not exercise eternal vigilance. The deception will surely be carried to those who are not on guard within themselves, and they too, will flatter themselves with a purity of motive which they have not attained to.

And yet, gigantic as is the task which brings clear vision, it is within the power of all. Nothing but indifference, discouragement, and despair can delay its coming. The teaching is that in searching for the Souls of others one finds his own. This is one of the paradoxes of which life is made up.

No doubt the Silent Watcher comes forth from his hiding-place unbidden to aid in the search, for this has removed his obstructions; whereas a turning of one's forces upon oneself but clogs the openings, and in time seals them fast. STUDENT

Practical Education

IT is reported that the Principal of the Forestville School, near Chicago, has planned the unique experiment of having her 1200 pupils co-operate in designing and building a brick bungalow on the school grounds. The entire work, from the drawing of the plans to the preparation of a dinner for the housewarming is to be done by the boys and girls.

Operations will begin with a designing competition among the children in the two upper grades. The school architect will select the best plan and the children will then tear up the brick pavement of the playground and start the walls of the bungalow. While the building is in progress the girls will be at work making furniture and other things for the interior.

"I want to get away from the idea that the child to enjoy himself must be playing all the time," says this progressive teacher.

It is refreshing to find an experienced teacher who is not psychologized with the prevailing custom of thinking and acting for the child instead of training him to use his own mind and muscles. The public school, like all other institutions, has undergone radical changes in a generation; but the results are so far from satisfactory as to elicit unfavorable criticism from thoughtful parents and teachers. Seemingly the educators have been analysing every subject except the most important one—the

child, with his complex make-up. Any system of training must be unsatisfactory which is not based upon a clear conception of the dual human nature, "half dust, half deity," which struggles for supremacy upon the battleground of mind. Education is primarily a moral question. The very complexity of our modern civilization makes it the more imperative for

teachers as to their true character. By impersonal and unselfish thought and action the higher nature finds the joy of growing more aware of its own richness and power and beauty of being. Self-discipline is the essential thing in training for citizenship in a world where good and evil show how the forces of human nature can act with equal power in opposite directions.

We must live to enjoy life—not merely play at living or get someone else to live for us. The idea that the child must be entertained and amused instead of getting interested in ways of using his creative energy along purposeful lines of activity is an error injurious to his youth as well as to his adult years.

Life is a graded school which each one must attend until he has perfected knowledge into wisdom. Any less conception of human destiny simply leaves our existence without definite plan or purpose; and any institution must prove inadequate and unsatisfactory which is not based upon a right relation to the general scheme of things. In real education the cultivation of the mind is secondary to the development of character. It is not masses of the latest scientific opinions which are carried over from life to life, but the power to think and the will to do. R.

New Wine, Old Bottles

THE University of an Eastern state, following on the announcement that a woman has matriculated in its law department—being the first of her sex to do so—has now requested her to surrender this distinction on account of the time-honored rules of the institution, which bar the doors of certain departments to women.

"It is not the policy of the University to encourage the study or practice of law by women," said

one official, and the Dean is quoted as saying: "The presence of a woman in a law class, in my opinion, necessarily restricts the progress of the work"—which reminds one of the old story of a man who loved chill and bleakness, and who one day saw the buds opening on a nearby tree and heard a robin's note. He snared the bird and stripped the tree of every opening bud. Then he went back content. He had outwitted the evolutionary forces, had insured a continuance of winter and had put back the Spring. H.

MYFANWY OF THE MOUNTAINS

WHO loveth the child of a man,
He seeketh great gifts in return;
He burns and is under a ban
For the sake of the love he would earn.
But with Thee are no gifts for the winning,
O Daughter of God!
Were it earned for Thy sake, 'twere not sinning
Hell's nethermost cave if we trod;
We would burn for Thee singing in deep hell, making
sport of
The flame and the rod.

We seek naught at Thy hands, and desire
Not e'en Thou shouldst know that we be.
We but live, and not falter nor tire,
That Thy life may be splendid and free.
Naught hast Thou we crave of Thy giving,
Thy love nor Thy praise;
Live only, and shine on the living;
Shine only, and lighten their days!
So sad hath this world been without Thee; so
wandering on
Miserable ways.

Should we say Thou art fairer than aught
That blooms 'neath the moon and the sun,
Our words were all empty and fraught
With the stuff whereby words are undone.
For Thy beauty is timeless and nameless,
And naught to be known
Of vision not utterly blameless
And fearless and passionless grown,
Lest eyes should be bittered and blinded for Thy
sake where
Thy splendors were shown.

Thou wert crowned and imperial of old.
And Thy mandate went forth from the Isles.
Thou wert necklaced and girdled in gold;
And Thy wisdom out-mastered the wiles
Of demons that wrought to ensel Thee
In silence and wrong:
There was none that had might to compel Thee!
There was no man so wakeful and strong
He could break down Thy brightness, Myfanwy,
nor quell Thine
Enchantment of song.

Yet we know that Thy glory grew dim
And was circled with silence of yore;
And Thy Day-Star went down 'neath the rim
Of a crimson, waste world wracked with war;
We know that the witless have deemed Thee
A memory grown cold,
Since no warrior arose and redeemed Thee
Of Thy War-lords immortal of old:
Thou art lorn on the mountains—but sunset and
dawn are Thy
Queen's robe and gold.

But Thou touchest the hills with Thy feet
Till they bloom forth in glamor and song;
Thou dost pass o'er the moss and the peat
And the wild waters beautiful throng.
And of Thee is the wind's music rousing
The chant of the sea;
And the bees with their melody drowsing
Are laden with sweetness of Thee,
Thou Maid of our love and the mountains; Thou
Queen that hath
Been and shall be!

Thy face hath been glassed in dark tarns,
And the mist was for gems in Thine hair;
Thou hast roamed mid the clouds and the cars,
And had throneless abiding-place there.
And we mourned and were dumb through the ages,
Remembering Thy grace
When Thy throne was encircled with sages
And the high-souled and kingly of race
That enriched Thee with deeds and rich love, ere
they passed
In the noon of Thy days.

But Thou art not to sink to Thy grave,
And time shall not descend on Thy doom;
There's a star risen far o'er the wave,
And a hope for Thee risen o'er the gloom:
And no man foreknoweth the splendor
Shall shine from Thine eyes,
Nor what homage the princes shall render,
O lovely and perfect and wise!
They shall kneel, as they kneeled down of old time,
and sound
Forth Thy praise to the skies.

There's a whisper is over the world;
Hush, darling of darlings, and hear!
There's a little white wavelet is curled,
There's a gleam on the sea drawing near;
There's a bark on the waters, thou White One,
Put forth from the sun;
And crowned on its high poop a bright one,
And the kings of the night are undone;
And they that put scorn on Thee tremble, for they
know that
Their courses are run.

And Thy voice shall be heard of mankind,
And Thine old mountain wisdom shall heal
The sick, and give sight to the blind,
And Thy white hands shall weld the world's weal.
And Thou shalt not be hindered, Myfanwy,
From service nor song;
Thy name shall be treasured of man; we
Shall crown Thee and throne Thee ere long:
O star of our deep adoration, Thou shalt reign and
do deeds
And be strong!

Kenneth Morris

the individual and social welfare that the human relationships be harmoniously adjusted.

The cramming process at school and the strenuous life around the precocious modern child stimulate the dominant part of his nature; he is capable of more good as well as of more evil than his less conscious ancestors. The lower nature depends upon indulgence and sensation for its gratification and has no lasting source of happiness. Often the more refined phases of self-indulgence are fostered because their subtlety deceives parents and

OUR YOUNG FOLK

IN THE AUTUMN WOODS, IN FRANCE

The Great Quest

AN old man, with a little boy by his side, was trudging slowly up the foothills on the approach to the great mountain range that lay before him. He seemed very, very tired, and from time to time would glance down at the little fellow and give him a word of encouragement. Where were they going? Perhaps they did not know themselves, but they knew that in their hearts was a great yearning to reach a spot somewhere on the heights where they might become cleansed and refreshed. The sun baked down on all sides of them; the verdure lay prostrate; even the soil was cracked and rent. Now and again a little gopher, sitting absolutely lifeless to all appearance, would drop down into his hole, as if he had been snatched away from the earth. A few meager buzzards sailed about with a hungry look. But a touch of good, fresh spring water, and all would come to life.

The travelers had passed up beyond the arid foothills and were just beginning to enter the timber-land. Their faces brightened, for the fragrance of the pines was most strengthening. When they entered into the shade of these trees, a delicious coolness enveloped them on all sides. Every limb began to loosen up; every pore breathed eagerly the invigorating air. They raised their heads, and up through a vista they caught sight of a little patch of clean, glistening snow on the bald crags. How mightily the mountain top seemed to raise its head, and so free, as if it had never stooped to earth! The nearer they approached the more it assumed an expression of intelligence; it became the very embodiment of strength, endurance, and majesty.

"Well, my little comrade," asked the elder, for, though the boy was his son, he had always treated him as a comrade in the battles of life, "do you feel more encouraged now? Surely upon that mountain, where lies that

clean patch of snow, we shall have fresh water to drink, clean water to bathe in." In reply, the little fellow delightedly squeezed his father's hand. A voice within said that there a new life would begin.

At last they passed the timber line and with a bound sprang upon the last crag that separated them from the snow; and sure enough, snugly placed in the hollow of the snow, was a cool, clear pool. Before the dignified majesty of that great mountain head, they bathed and drank; they had found the elixir. As they got up to depart they saw through a ridge in the mountains a plateau upon which sparkled in the sunlight many magnificent buildings all wrought in gold. Yes, they had reached a new plane of life.

The song in their hearts can alone tell of the ever-increasing joy-life begun at that moment. Their quest was at an end. **STUDENT**

How the Blind May Lead the Blind

A SHORT time ago King Edward VII knighted a blind man, who has done much to show what the blind can do to help the blind. Sir Francis Joseph Campbell was born in Tennessee in 1833 and lost his sight as the result of the careless treatment of a wound in one eye made by the thorn of an acacia tree when he was a boy of three. When he was ten a school for the blind was opened near his home and he was sent to it. He was so quick to learn that the alphabet took him less than an hour. The teachers decided that he was not musical and gave him no lessons in music; but in three months he picked up all they had taught the other pupils. Now he is the head of the Royal Normal College and Academy of Music for the Blind, in London. His work as a teacher of the blind, and as a promoter of the movement encouraging the employment of blind musicians as organists, etc., has won for him the affectionate recognition of the English people and the

friendship of the King. This blind teacher is said to be a most energetic, enthusiastic worker, full of hope that broad areas of helpfulness may be opened to the sightless. Such a man is a true helper, one to whom everyone must feel a debt of gratitude. **L. P.**

Art Speaks for Itself

THE following anecdote of Marietta Alboni, who was the greatest contralto of the nineteenth century, is a refreshing contrast to the methods often employed by artists today to secure public favor.

Before Alboni made her *début* in Berlin she was advised by a too solicitous friend to secure the good graces of the most influential journalist in Prussia as her prospects for success would be ruined without his favorable report. "Indeed!" said the beautiful singer, with great dignity. "Well, let it be as Heaven directs; but I wish it to be understood that in my breast the woman is superior to the artist, and though failure were the result, I would never degrade myself by purchasing success at so humiliating a price."

This incident became known in the highest social circles of Berlin and instead of proving detrimental to the young prima donna, won for her the greatest admiration and respect. The king invited her to sing at court where she received great applause and honor.

Alboni's honesty and courage in upholding a high principle by standing on her own merits might well be emulated. No amount of adverse criticism can prevent the ultimate recognition of real art, and faithfulness to high ideals always brings its own great reward.

THE CHILDREN'S HOUR

THE FAIRIES' RECALL

WHILE the blue is richest
In the starry sky,
While the softest shadows
On the greensward lie,
While the moonlight slumbers
In the lily's urn,
Bright elves of the wild wood!
Oh! return, return!

Round the forest fountain,
On the river shore,
Let your silvery laughter
Echo yet once more;
While the joyous bounding
Of your dewy feet
Rings to that old chorus:
"The daisy is so sweet!"

Oberon, Titania,
Did your starlight mirth,
With the song of Avon,
Quit this work-day earth?
Yet while green leaves glisten,
And while knight stars burn
By that magic memory,
Oh, return, return!

HUNTING FOR FAIRIES IN LOMALAND

The Little Gardener

LITTLE Janet looked rather ruefully at her well-pruned garden; it seemed only a collection of little brown sticks. Gone were the sweet smelling roses and fragrant jessamine. The gorgeous blooms of the hydrangea no longer gladdened her eye, and the time of the violet, that sweet winter flower, was not yet.

It was a warm land in which Janet lived and the twilights and winters are short there and the sun is such a friend of the children that they miss the long days of sunshine, even for so short a time. Perhaps the sun knows, for there is scarcely a day even then that he does not look out the grayer skies, night or morning, just to give them a greeting. This afternoon he had been hidden behind a thick mass of cloud, and what with the dull sky and the shorn garden, in a world stripped of color and light and perfume, Janet was feeling a rather forlorn little girl.

Putting their tools away, they went into the house. The elder children, Ben and Lucy, chatting gaily together, went to the fireside. Janet stood by the window. The sun peeped from behind the clouds as he sank from sight below the horizon, and the long shafts of light, thrown upwards, gilded and painted the sky with wondrous tints of rose and gleaming gold. The leafless branches of oak with their thousand branchlets and twigs showed up like a delicate carving of oriental handiwork against the tinted evening sky. So beautiful it was, that the child's inner questionings were stilled, and she felt the hidden promise of spring in the erstwhile bare brown twigs. So she turned from her window and joined her brother and sister by the fire, with the old happy light in her eyes.

"Well," said Ben, with a twinkle in his

eyes, "what was the lesson about today?"

Lucy put her arm round her and stroked her hair.

"The gardens looked dreadfully bare, didn't they, Ben? Hardly anything but bunches of little brown sticks; no flowers, no buds even!"

"That is so, Sis," he said, and waited.

"And there was no sun to be seen," went on Janet, "everything looked so cold and gray, everything seemed to be buried," she finished emphatically.

Lucy nodded sympathetically and Ben wondered what his little sister was thinking about, and kept silent.

"I wondered if the plants wanted to be cut off, there seemed such a big pile of cuttings and such little bushes left and not even a leaf left on them, and only a few weeks ago it was such a lovely garden; and I felt I wanted to cry, only something inside me said 'Don't.' But I couldn't understand and then I went and stood by the window and the sun came out and everything looked so beautiful; and when the light fell upon the branches of the trees, I saw the little brown buds at the side and remembered that new leaves and flowers were all there inside, waiting to come out with the spring and that the little brown sticks weren't dead at all, but dear kind nurses taking care of the baby buds, till the warm weather comes again. And I thought too, that everything needs a rest sometime, or it could not store up strength to blossom, could it Lucy?"

"No dear," she answered, "and when the plants are properly pruned, it is only the waste material that is cut away, the useless parts, and it helps the plant to grow stronger and

bear better flowers, just as we grow better when we prune away our faults and failings."

"And the sensible plants, like the sensible people, rejoice when the pruning time comes," said Ben, "even if it does hurt a bit, it is well to remember 'that a prolonged call on the services of the Rainmaker is apt to be depressing to other plants alongside.'"

"Your metaphor is mixed, good brother," said Lucy, "but no doubt your intentions are good."

Janet looked puzzled. "The sun is always behind the clouds, isn't it?" she asked. "Do you mean that we should be patient till he shines again and remember that it takes all kinds of weather to make a plant strong?"

"Something like that," said Ben, and added, half to himself, "and the deeper the silence, the wiser the speech."

ETHNE

A New Language

For the words of earth are little worth
When a song drops out of the sky.

NATURE'S living silence is a language of melody that sends a song thrilling through our hearts, awaking our minds to the knowledge that we are souls. When we begin to study this new language, we do not have to search for an easy method. Nature's lessons are very simple; "Live for others," "Work in silence," are the beginner's "five-finger exercises." We need only to practise at five-minute intervals, but frequently and diligently, to find our teacher at hand to show us at each new step in our daily actions how to think in the soul language and put ourselves in tune with Nature's melody.

THE MYSTERIES OF THE HEART DOCTRINE

PREPARED BY
KATHERINE TINGLEY
AND HER PUPILS

The Theosophical Book *of the* Twentieth Century

Tells the story and the history of the Theosophical Movement.

The prices are \$2 in cloth and \$1 in paper, which barely cover the cost, for it is printed and bound, not gaudily, but with such carefulness and thoroughness of art and craft as to make it unique among modern edition books.

ORDER FROM THE
THEOSOPHICAL PUBLISHING CO., POINT LOMA, CAL.

Isis Conservatory of Music OF THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY POINT LOMA, CALIFORNIA

Personal applications and inquiries received every Saturday
by the Secretary at SAN DIEGO BRANCH

ISIS HALL, 1120 FIFTH STREET

between the hours of 9 A. M. and 4 P. M. Full particulars will be sent by mail upon application to

J. H. FUSSELL, SECRETARY AND TREASURER,

The Power of Prayer

things, that

There is nothing so reasonable as the doctrine of prayer, nothing so practicable, nothing so effective in its impression on character. . . . We should pray when we walk, when we are lying down, when we are asleep, when we are washing dishes, when we are at the counter. God gives us light, but he is more willing to encourage us and to answer our prayers than he is to give us light. . . . There is nothing so valuable for individual discipline as the concentration of the mind on the individual promises concerning prayer. . . . How necessary that we should use the passing days in the cultivation of the habit of communion with the living God! . . . Pray without ceasing, that you may come to breathe in the realm of God.

He also suggests means of concentrating the mind more; as, for instance, by writing out our prayers.

Now what is the common-sense in this matter? Evidently prayer, as thus described, consists in concentrating the mind and directing the will with the intention of evoking some power that will bring about the accomplishment of our wishes. And what is the power which is invoked or evoked? The answer to this question is that it is not always the same power; it may be one of several different powers. *It is our motive that determines the difference.*

The concentrating of the mind upon an idea, accompanied by an exercise of the will, tends to bring about the accomplishment of that idea. The man uses the creative powers with which he is endowed. Just as an architect first designs the contemplated structure and then executes it, thus combining the imagination with the executive powers in creating something; so the man who prays for an object of desire utilizes his imagination in conjunction with certain executive powers in order to create something. It does not follow that the effort will be successful; it may not have been strong enough or skilful enough; and other forces of like nature—perhaps other people's prayers, possibly our own prayers on other occasions—may interfere and neutralize the result. We set in motion a force endowed with a tendency that may be frustrated or modified by mingling with other forces.

Right Prayer
Depends on
the Motive

Whether the prayer is holy or not depends altogether on our motive in making it. If it be merely a personal desire, then it is no more holy than any other kind of personal desire. Like other personal desires, it is *conceived in*

unwisdom. It will go forth into the ether and blend indistinguishably with all the other forces there. When the ripple strikes back upon its sender, it will probably be in a form and at a time when he neither expects nor welcomes it. The sending forth of such concentrated desires by innumerable people can obviously only result in increasing the conflict of selfish wills, already so severe. It matters not that the petitioner imagines or believes in a God; if his prayer be selfish, it will arise to the lofty throne of no beneficent intelligence. Weighted with the dross of earth, it will obey the laws of gravitation, hanging about in the murky atmosphere of desires, and attracting no power higher than the powers that execute selfish desires. Thus it will be similar in kind to, but more hypocritical in spirit than, the prayer of a tribesman addressed to his tribal, family, or even personal fetish.

Some of these prayers may be less selfish and more enlightened than others; we may pray for grace and guidance. In most of these cases there will be a mixture of good and bad elements in our prayers. The most unselfish kind of prayer we can imagine takes the form, "Not my will but thine be done!" At times, when horrified with some evil, a *pure aspiration for good* may well up in our heart; and that is a true prayer.

So prayer is simply a use of the creative powers of desire and imagination, and its character is determined by the wisdom of our understanding and the purity of our motives. Praying for the destruction of an enemy, whether a hostile army or a vivisectionist, is an act of *black magic*. Even if a sincere evangelist should pray for the conversion of an unbeliever, he would be exercising an undue

interference with another's free will. A mesmeric force would go forth from him and might affect that other; it might actually convert him for a time; or it might become transformed and produce some other effect on him. Or again it might rebound upon the sender. A true Occultist or White Magician might, if he chose, thus coerce the wills and influence the minds of his disciples; but that is not his purpose; his purpose is *to persuade them to use their own wills*. Hence he will never interfere with the free will of another under any circumstances whatsoever.

Praying for material advantages is no use, because we cannot thus escape the law of retribution which evens things up. Moreover, it strengthens the selfish nature, thus deadening the spiritual. Desire for personal advantages is a tyrant, whether exercised through

prayer or otherwise. Praying for spiritual gifts is good or less good according to the amount of wisdom and unselfishness there is in it. *We may actually create an idol in the shape of some personal God* acting as our protector. This cripples our spiritual nature and promotes an attitude the reverse of manly and self-reliant. *Selfish piety and "Jesus-ism"* is not a very estimable ideal.

Let us pray that the divine will may be accomplished regardless of our own personal wishes and notions. Let us strive to eliminate the notion of gain and advantage. Above all let us remember that *the truest prayer is right action*. By petitioning we show forth our weakness; we show forth our strength by acting. Instead of waiting to be made good, why not *be good*? STUDENT

Is Mind a Property of Matter?

AN instance is given below of the confusion of thought which sometimes results when a man whose special aptitude is for studying natural phenomena ventures into a domain where he is a stranger and attempts to give a definition of "mind."

In a review of a book on experimental embryology it is stated that the author admits growth to be due to the interaction of external influences and internal qualities. So far good; but when he comes to define his internal qualities, we come upon the mental obfuscation alluded to. He says:

Mind is not matter, not even living matter; rather is it the new quality constituted by an increase in the complexity of living matter, immaterial and as distinct from that matter as is "blueness" from vibration of a certain wave-length. Dependent on and inseparable from matter, however, it is; when that matter, whether in the individual or in the race, attains a certain degree of complexity, then and then only does mind appear; and with the disappearance of that complexity it perishes.

This reduces mind to a mere descriptive word defining a certain order of vibration or a certain arrangement of parts in matter; and, as such, it belongs to the same class as words like *viscosity*, *rotation*, and *temperature*. We should have to speak of a person's mind as we speak of his height, weight, or complexion. In fact, mind, as thus defined, is not an entity but an abstraction—a concept formed by mentally isolating from an object certain qualities which it exhibits. This logical blunder is that to which Stallo gives the name "reification of concepts," and of which he finds innumerable instances in accepted theories.

But even granting that the word can be used in this sense, the matter is not settled, for it becomes necessary to know what is the agent which causes matter to produce this effect called "mind." Let us take an illustration in our turn.

Compare the living, growing organism to a house that is being built. The biologist can see the bricks and beams, but the builders emit only ultra-violet rays, let us say, so that he cannot see them. The problem to be settled is: What is a house? And its solution includes the question: Whether the house builds the bricks or the bricks build the house? The house, says our biologist, is "a new quality constituted by an increase in the complexity of the bricks; only when the bricks attain that degree of complexity does the house appear;

and when they lose it the house perishes." This may seem to settle the whole matter, so far as he is concerned; he may rest satisfied with the theory that the bricks build houses. But more inquisitive minds will certainly want to know something about the builders and architects.

Applying this illustration, we ask: Where and What are the builders and architects which cause the living atoms to build themselves up into mind? For it is as difficult for us to conceive of matter creating a mind as to imagine bricks building houses.

One could spend reams of paper in tracing out the absurd consequences resulting from such a hypothesis as that mind is caused by matter. Whatever produces mind must be greater than mind itself; and our theorist but exalts his "matter" to the throne vacated by the theological deity, with all of whose functions he endows it. We are willing to grant him that the atoms of matter create "mind," if only he will permit us to bow down in respectful admiration before those omnipotent atoms and to dignify them by some better word. We are ready to limit the application of the word "mind" to such of our functions as may be due to the vibrations of our own molecules, if only he will permit us to use another word to designate certain other prerogatives which we feel sure we possess.

If the idea be ridiculous when applied to the animal mind, it becomes still more so when applied to the human mind. The characteristically human attribute of self-analysis is one that cannot possibly be even expressed in terms of any static or dynamical function of matter or atoms. And to cap all we have the supremely farcical idea of a machine speculating about itself! Is it not rather late in the day to be rehashing these delusions of the last century? T.

That Egyptian Mummy Again

AFEW months ago the list of the calamities which had befallen persons attracting the ill-omened attention of a certain mummy, that of the priestess Amen Ra, in the British Museum, was detailed on this page. The list has lengthened itself, and is thus given complete by a contemporary:

Four young men brought the empty mummy case to England from Egypt. One lost his right arm when his fowling gun exploded. Another was shot dead. A third lost most of his fortune and died soon thereafter. The fourth died in poverty recently.

A sister of one of the men fell heir to the mummy case. Many misfortunes followed. A photographer photographed the lid. The developed negative showed the face of a living Egyptian woman of malevolent aspect. The photographer committed suicide.

Then the case was taken to the museum. The man who took it there died in a week. Another who helped him was badly hurt in an accident.

Another photographer photographed it in the museum. Then, in an accident, his camera was smashed and his face cut. One of his children narrowly escaped drowning a few days later.

H. F. Robinson of the *Daily Express* wrote a story about the mummy case. Within a few weeks he died. An American magazine employed a man to write the story of the haunted lid. He died before he finished it.

A school teacher ridiculed the stories about the lid as she inspected it. She fell and one of her arms was broken. The daughter of the Marchioness of Salisbury contemptuously cut a caper before the pictured face. Before she left the museum she fell, slipped on the stairs and sprained an ankle.

Another woman derided the story while looking at the face. In an accident later one of her elbows was fractured.

Evidently even the Museum authorities have become impressed by the deadly uniformity of events, for the case and contents are to be removed from the Egyptian room.

Readers are referred to one of three possible explanations of the matter, which was suggested in this column, issue of April 11 last. But it will hardly find favor in scientific quarters. STUDENT

Sevens in Crystals

"PYTHAGORAS," says a physics textbook, "who had not yet outgrown the childish tendency to attribute special significance to particular numbers. . . ."

Nor, it would appear, has modern science, and for the very good reason that nature herself, the material of science, has also so far failed to outgrow that tendency. She still holds *sevens* in reverence and submits to their regulating hand. Dr. Tutton, F. R. S., speaking on crystals before the British Association at Winnipeg on August 26, began:

The proverbial importance of the number seven is once more illustrated in regard to the systems of symmetry exhibited by solid matter in its most perfectly organized form, the crystalline. For there are seven such systems or styles of architecture of crystals, just as there are seven distinct notes in the musical octave, and seven chemical elements in the octave or period of Newlands and Mendeleeff, the eighth or octaval note or element being but a repetition on a higher scale of the first.

The seven systems of crystal which he enumerated are: the cubic, the hexagonal, the tetragonal, trigonal, rhombic, monoclinic, and triclinic. The trigonal, whilst a really definite system, often does not get separate enumeration. STUDENT

How Does a Cat Alight on its Feet?

THE trouble which people have had over trying to explain how a cat always alights on its feet seems to be owing to the fact that there is theory which forbids it to do so. For a falling cat is a self-contained static system, and should not be capable of rotation by its own internal forces, but only by reaction upon something outside. It is not considered possible that the cat reacts against the air; hence it has no purchase, so to say, and any twitch intended to rotate part of its body in one direction would result in imparting a contrary rotation to another part. Photographs of falling cats have been taken and studied, but with no very satisfactory results. One would like to know whether the theory is out of gear, or whether, like the cat, it can be made to fall on all its four feet. H. T.

The Gatun Locks

SEEING that the credit of the engineering profession is at stake in the construction of these locks, it is reassuring to find that a principle recognized in the design of the Vyrnwy dam of the Liverpool waterworks (and by the present writer in the design of monolith breakwaters), is also recognized at Gatun. It is, that the full hydrostatic head may press upward against the lock floors through possible rock fissures. This will be met by anchoring down the thirteen feet thick floors to the rock by steel rails penetrating the rock ten to fifteen feet. M. INST. C. E.

Some Views on XXth Century Problems

Mental Gymnastics

THE spirit of obscurantism has had to change his form in our time. For the modern man it had become too late to say, Thou shalt not think; we will think for thee; accept these dogmas whole, as they stand, and go unquestioning about thy business and thy pleasures.

So the only way to stop the thinking which might lead to spiritual freedom was to provide some method whereby the mind might think it was thinking whilst its wheels were really as still as under the old régime. Something that looked like a philosophy, like a pregnant philosophical mysticism, had to be given, yet it had to contain the negation of its own examination.

The systems that depend upon assertion and denial, satisfy the requirement. Mind is (quite correctly) taught that it is dual. The assertions and denials accordingly serve a dual purpose. On the one hand they bring the lower mind to a hypnotized standstill absolutely unsuspected by its possessor; on the other they make it believe that they themselves represent the workings and deliverance of the higher. Which higher can but look on helplessly at the ruin.

The lower mind, even in persons who do not thus drug it, rarely gets its due of exercise in all its muscles. We read a great deal, chiefly the newspaper, novels, and books of travel. That again is often mere self-drugging; and those who do most of it have often the least well-furnished minds and are least capable of an intelligent contribution to a conversation. They do not read for introduction to new thought, nor for the acquirement of needed knowledge, nor for the positive gymnastic of a new train of fine feeling. Their minds have lost the power of reaction and assimilation, and cannot gain either thought or knowledge or feeling. Reading is no true mental exercise unless the knowledge or thought or even feeling to which the mind has applied itself is so seized and arranged as to be capable of expression, capable of being written or spoken back to real or imaginary readers or auditors in the terms and stamped with the impress of the mind through which it has passed. If one reads a page of a foreign grammar it is with the intention to express something at the proper time in that language.

The highest function of the lower mind is spiritual, its rising into communion with the higher so as to get filled with light and ultimately with transcendental knowledge or intuition. This; thought originated within or arising and continued on from what has been read; and right reading for its various purposes, are proper and necessary exercises for mind. Below these lie the ways of stultifying it, negative and profitless reading, and the assertions and denials. STUDENT

The Fate of the School

A PUBLIC school must be a sad spectacle from a certain point of view. It is filled with progressive boys, exhibiting as they grow older every possible variation of character, intellect, and attainment.

Some of these variations are objectionable and are finally weeded out; some admirable and are conserved and encouraged. Various boys adapt themselves to their tasks, assimilate quickly, and are transferred to other classes for new branches of study. A few seem to accomplish nothing, remain in the class where they began, and at last are seen no more.

The two visitors, from Venus and the Moon, were looking on. "It is a fine spectacle," said the former, "to see all these boys and young men passing up from class to class and finally emerging from the highest, ready for real life."

"Real life," said the Lunatic; "what do you mean by that?"

"What do you think is the purpose of this school?" rejoined the other. "Do you imagine all this learning is acquired for nothing?"

"I think it would be wholly illegitimate," replied the Lunatic, "to read *our* ideas of purposiveness into it. All that we are entitled to say is that we see progressional acquirement of power and knowledge."

"What then," asked the Venus man, "do you imagine will be the end of the whole thing?"

"The end of the whole thing," answered the Lunatic, "will unquestionably be the dissolution of the school and therewith the dissolution of the pupils. Other schools may no doubt come into being elsewhere, exhibit the same long chain of phenomena, and in their turn dissolve with their finished and unfinished pupils into molecular chaos."

A correspondent of the (New York) *Nation* writes:

When the solar system comes to an end, as it seems it must come, the race of men or even of supermen will not have left any contribution to the hierarchy of archangels whose existence Mr. Bernard Shaw poetically imagines as a future possibility in direct line from the amoeba. This particular series of evolutions will have come to an end. Simultaneously perhaps myriads of other evolutions and dissolutions are going on, with no more permanent results. STUDENT

Message-Bearers

THE anniversary of Tennyson's birth has produced a good deal of writing about him and his message. To get the message there has been a good deal of diving into the poems, perhaps mostly *In Memoriam* and *Locksley Hall*.

But the result has not been great. The message of some undoubted message-bearers to their time is not a proposition at all, nothing that can be formulated in a statement, sometimes not even a view. Let someone give us Shakespeare's view about *anything*! That was not his business. A good many people who have appreciated Wagner's message in the very marrow of their bones, think we should have lost nothing, and his message gained much, if he had never written a line of prose.

A poet has no message who writes exactly on the level of popular feeling, however purely. No one ever spoke, for instance, of Cowper's message, or Eliza Cook's, whatever his just esteem for them. The message bringer is he who begins there where the people's feeling is and carries it as high as it can possibly be made to go. If he began beyond it, he would

have for the people, no message. Nor yet if he went beyond its capacity to follow.

In that way Tennyson had a message or a work, not a doctrine. He linked the people by links which they recognized and for which they were grateful, to levels of feeling they had never before touched and never otherwise would have touched. He taught them the possibilities of rich and noble and tender music in their own tongue. In the same poem he could touch the schoolgirl and the man of finest nineteenth century culture. He brought them nearer their souls simply because he wrote in the light of his own soul. He never seems to have translated that light, even for himself, into a doctrine. He felt what the people needed. Maybe he felt it before his birth and limited himself in advance, in his brain life, so as to attend more absolutely to that need. There are souls who do that, who for the space of a life hold back as it were a part of themselves from themselves (as incarnate thinkers) lest it overload their work.

STUDENT

Candy and Crime

NOBODY has yet tried to work out a connexion between candy and crime, and we have no desire to launch a fighting theory on the subject. But there would be a certain amount of precedent. If one physician may connect crime with defective eyesight, and another, with a blond complexion, why should not some third advance the claims of candy? Unsuspected bad sight produces brain-strain, nervous irritability, and thence, in predisposed persons, accentuates their tendency to outbursts of violence. A blond complexion, says Dr. Woodruff, is unsuited to the amount of sunlight of our climate; to exclude the excess we need to be brunettes:

Hence in America we find more nervous instability among the blond types and more of them drift into crime as a result.

Candy-eating is increasing in this country. An article in a recent *Literary Digest*, headed "Candy by the Ton," tells us that

There are now many factories than can, with comparative ease, turn out more than 50 tons a day each.

What they can do, they usually *do* do.

The candy is not eaten by those who can best digest it; that is, by those who do most outdoor work and take most physical exercise. Much the greater bulk of it is eaten by the city-dweller whose digestive processes are slow and give opportunity for fermentation, and whose oxidation is considerably below standard. Under these circumstances the candy has every chance of developing alcohol, acetic and other acids, acetone, and the like—all of them nerve poisons, all of them productive of nervous instability and all of them causing at least as much tendency to the "drift into crime as a result," as a blond complexion or astigmatism.

Such an argument could very well be maintained, and would have the same sort of relative truth as the others, and more of it. Until we have reformed our systems of education, the mind will usually take its color from the nerves and feel accordingly. STUDENT

Papyrus, Pyramid, and Theology

THE Christian religion, the Pyramids, the "Book of the Dead," and Freemasonry, — are they related?

After inspecting the Great Pyramid, reading the "Book of the Dead," and comparing the two, Mr. W. Marsham Adams, formerly Fellow of New College, Oxford, came to the conclusion that he had found a clue to a part at least of the Wisdom of the Egyptians. The book, he believed, was the papyrus counterpart of the pyramid, the secret passages and chambers of the one having their correspondence in the other.

Such a theory was not, of course, orthodox, and the author of it had to stand the severe comments of the critics, for is it not written that the pyramids are really nothing more than the tombs of monarchs who flourished from the 1st to the 12th dynasty? One Egyptologist, however, was on the side of Mr. Adams. This was Professor Maspero, who wrote to him a letter in which he said:

The pyramids and the Book of the Dead reproduce the same original, the one in words, the other in stone.

The Professor added that no Egyptologist had dealt with the subject before. Mr. Adams points to a tradition amongst the priests of Memphis which supports his contention that that "Secret House" was the scene where the neophyte was initiated into the mysteries of Egypt.

Mr. Adams may have been the first Egyptologist to take the view that the papyrus and the pyramid were reproductions of the same original, but his "contention" that the pyramid was the scene of initiation was not new when he promulgated it, for in *Isis Unveiled*, published in 1877, Madame H. P. Blavatsky makes the following reference to the purpose of the pyramid:

Internally it was a majestic fane, in whose sombre recesses were performed the Mysteries, and whose walls had often witnessed the initiation scenes of members of the royal family. The porphyry sarcophagus, which Professor Piazzzi Smyth, Astronomer Royal of Scotland, degrades into a corn-bin, was the baptismal font, upon emerging from which, the neophyte was "born again," and became an adept.

Origin of Planetary Symbols

SOME correspondence in the *English Mechanic* refers to the origin of the signs for Mars and Venus — that is, a circle with an arrow-pointed line projecting from its northeast side, and a circle with an equal-armed cross below it. One writer says:

They are apparently derived from the Crux Anata, and of phallic origin.

H. P. Blavatsky has protested against this habit among modern Western investigators of tracing ancient symbolism to a phallic source. The circumstance that an analogy can be traced between some of these symbols and that which the investigators say they represent, is due merely to the universal analogies of all Nature. Equally well might we assign a phallic meaning to the Arabic numeral signs, 0 and 1. In

Lomaland Photo. and Engraving Dept.

ONE OF THE COMMUNAL DWELLINGS OF TAOS PUEBLO, ADJOINING THE CARSON NATIONAL FOREST, IN NEW MEXICO

Its people are peaceful, clean, happy, and well governed

fact, to be brief, there is scarcely an object, either in Nature or in the utensils of daily life, that could not equally well be maintained, from its shape, to have had a phallic origin. The idea is a craze. At this rate every tree and plant, every stick and stone, is phallic. The ancients, in their profound science, apprehended the fundamental principles of Nature, together with their geometrical correspondences. They represented the physical world by a vertical line crossing a horizontal one, to symbolize the force and matter, or life and form, of which pair (even in modern physics) matter is the offspring. Above this cross, to signify the dominating power of Spirit, they placed the circle, thus obtaining the symbol of the regenerated human Will triumphing over Matter by means of Divine Harmony ("Love"). This was the sign of Venus, Goddess of Compassion, Self-Sacrifice, Divine Love. And it has been degraded into a symbol, first of romantic passion, and then of mere appetite! And so with Mars: the circle denotes again, Spirit — it is the symbol of the Sun, the All-Father; the arrow indicates that this celestial energy is in motion. The sign stands for Courage, the all-conquering Will. It has been made into a symbol of bloody war, and then into a sign of mere physical virility.

These symbols were degraded in times that we call ancient, but which really belong to the same Dark Cycle in which we are now living. Reverence for Aphrodite, the All-Mother, a symbol of Harmony and Compassion, passed into the worship of Venus and became profaned by licentious rites. By degrading these

symbols and what they stood for, the classical world went to its ruin; and on its ruins their successors have planted their Cross, the four arms of matter without any Circle at all, aptly symbolizing our devotion to material interests and our lack of knowledge about things Spiritual. Modern investigators have a keen eye for the profanations, which they eagerly search out from the ruins of Asia Minor and Rome, and to which they even add further travesties of their own devising. If they had a loftier vision they might be able to discern the original unprofaned meaning of these symbols, which they had in days before men had deified the passions and the physical body. T.

Saracenic Steel

SHEFFIELD turns out the finest, hardest, and most perfect steel the world produces; but even Sheffield cannot turn out a sword blade to compare with those the Saracens made and used hundreds of years ago, despite the fact that the Saracens never possessed such machinery as ours nor had the advantage of modern knowledge of the metals.—*Exchange*

British Urns 3000 Years Old

BENEATH the brush at Pokesdown, near Bournemouth, two ancient barrows have been found, in one of which were discovered many urns, some of them in a state of perfect preservation. They are sun-dried, and are assigned to a period before the alleged Bronze and Iron Ages, and to a date of 3000 years ago. With them were found worked flints and arrow-points. H.

Diphtheria Figures

THE danger of the *post hoc propter hoc* deduction is better known than noted.

Since the introduction of the anti-diphtheritic serum the deathrate of diphtheria has markedly gone down. Therefore. . .

But not necessarily. At the recent International Anti-Vivisection Congress, held in London, Dr. Hadwen had some figures pointing the other way. The London Metropolitan Asylums Board have been giving annual statistics of diphtheria in their supplement, dividing the cases into those treated with and those without the antitoxin. The years covered are 1895-1907. The deathrate for those treated with it fell during that period from 28% to 10%.

But they (the Board) also give cases not treated by antitoxin. Here are the cases and deaths—these are their own figures. They start at 13% and wind up with 2.84%. So, while the deathrate of those treated with antitoxin has been reduced from 28% to 10%, the deathrate in the same period of the cases treated without antitoxin has decreased from 13% to 3%. Further, they acknowledge in the Report that those cases treated without antitoxin contain some of the worst cases—moribund cases where they dared not use the antitoxin.

We have not the Board's report at hand, and Dr. Hadwen's summary is not clear. There seem to have been two classes of cases reported upon, in one of which the original deathrate was 28 and in the other 13, the former class being selected for antitoxination. If we may judge the former class by the latter, the serum is doing harm—a conclusion for which there is corroboration. For these figures refer to hospital cases only. The fall from 28 towards 10, made much of, caused the pretty general adoption of the serum. Taking then the total figures of the United Kingdom, it appears that whereas during the ten years before the serum was introduced the diphtheria deathrate was 200 per million of the population, it afterwards rose to 235.

But this again is incompatible with the hospital figures. Our anti-vivisection friends should get their figures into better order, leaving no loophole for query. STUDENT

Living Crystals

THE discoverer of liquid crystals, Professor Lehmann, thinks that we have in them some clue to the structure of living matter, that a cell is in fact a liquid crystal, animated and to a degree self-directive. But he also regards *atoms* as animated, the "spirits" (his own term, translated) of them combining to form "spirits" of higher order.

The atoms whose spirits are thus united are altered, and no longer obey the laws of ordinary matter.

This view is somewhat astonishing for a physicist of his rank.

His liquid crystals have necessitated alterations in the previous definition of the crystalline state. A crystal was a hard, solid, homogeneous, anisotropic (that is, having lines or planes of unequal conductivity or reactivity) body, polyhedral and bounded by plane faces. All these terms except anisotropic have had

to go. Liquid crystals are of course neither hard nor solid. Some snow and ice crystals have been proved to be actually curved and not mere aggregates of very small flat-faced crystals arranged on a curved line. Crystals are not necessarily homogeneous and when they change form it is due to some of the molecules, whilst remaining chemically as they were, altering their internal polarity. In fact the molecules are then anisotropic. Lastly, though some liquid crystals are polyhedral (that is bounded by flat sides), some are true spheres, flowing freely as if alive like amoebae, and like them subdividing. They show their crystalline condition by dichroism, double refraction, and by certain filaments. Their flowings and other changes of shape, during which work is done, are transition steps towards a crystallinity which corresponds to the old definition.

His suggestion amounts to this: that a cell is a liquid crystal, the "spirits" of the atoms having combined to a higher unity which, because higher, has become directive and can accomplish objects of its own. The tendency of a liquid crystal is to pass down through a number of changes of form, liberating its energy as it goes along, finally reaching the stable crystalline form of the ordinary solid kind. The "spirit" of a living cell, a *living* fluid crystal, can stop this process at any point, utilizing the liberated energy of transformation for the purposes of its life, for example, motion from one place to another. It can absorb energy equivalent to what it has expended, from food, light, etc., and by means of this transform itself back to the original state, ready once more for work.

His view that the spirits of the atoms synthesize into a higher spirit, might be exchanged for another—that under the influence of a higher they synthesize into an organism through which that higher can realize its tendency to organic life. STUDENT

Solar Energy

AN astronomer points out that during hours when the sun is unclouded, the energy falling as light and heat on the deck of a ship would, if properly used, suffice to drive that ship.

On a small rug thrown on the ground, the sun pours a horse-power of energy [continuously]. If the solar energy that is poured down upon the Sahara could be set to work pumping water from artesian wells, that vast sand-waste might be made the great garden of the world.

Some few attempts to work with this have been made, mirrors being used to focus it upon water and the work being done with the steam.

A New York inventor has gone on another plan, collecting the energy as electricity. Says the *English Mechanic and World of Science*:

Mr. Cove has proved its efficiency for months by lighting his own home at Somerville, Mass., from storage batteries charged solely by his sun generator.

He objects to the view that the sun's heat can, as such, traverse space.

I am forced to conclude that the sun, if it had any calorific rays, could not possibly send them to

the earth through a space of ninety-two millions of miles having . . . a temperature of minus 142° Centigrade.

The sun, in his view, is not an incandescent body at all, its light being in part transformed on its way through space into electricity, and this on touching our atmosphere and earth, in part into heat. His apparatus, so far imperfectly described, is said to store the electricity direct.

So far, in respect of the harnessing of sun-force, we are about where we were twenty years ago—and Lord Kelvin much less than that—in respect of aerial navigation. Lord Kelvin said that flight, whether with planes or balloons, was impracticable and would remain so. Harnessing of sun force, of the force of the tides, and, in less degree of the winds, is similarly "impracticable and will remain so." Will it "remain so" another ten years?

In the matter of these sources there is probably nothing hindering our ready acquirement of the trick of taking and using them. According to the Teachers of Theosophy, that is not the case with respect to the infinitely greater forces locked within the atom. The philosophy of the thing is that our globe, like every other, was evolved and is maintained for the purpose of the evolution and perfection of human life. To deliver over the secret, or permit the unlocking of the secret, of inter-atomic energy to a race whose first thought upon any new discovery is, How can we put it to the work of war? would merely mean the stultification of the cosmic purpose so far as that race is concerned. And that will not happen. Quarrelsome children in the nursery are not allowed access to loaded revolvers.

STUDENT

The Cell We Live In

LITTLE by little we are adding to the structure of our planet, just as little by little we added to the structure of the cell. It was some time before there was a nucleus; since then the more we have discovered the farther we have gotten from the "structureless mass of living jelly" which was once our cell. The more we know the greater the complexity.

The earth was just a crust outside a core. The core is now acquiring a nucleus. Mr. Oldham, writing in the *Geographical Journal*, shows, by comparing the rates of travel of earthquake waves, that

in the center of the earth, extending certainly to not more than half, and, very likely, to not more than four tenths of the radius, there is material which behaves very differently from that which lies outside of it. In this central core the rate of travel of the first preliminary tremor is checked and reduced by about one-tenth, while the waves of the second phase are either stopped altogether or propagated but feebly, with their rate of travel reduced by one-half.

So we have already a nucleus and perhaps six surrounding layers—the circum-nuclear core, the crust (cell-wall), and three or four distinct atmospheric layers corresponding to cell-wall secretions of mucus and the like. The parallel could be extended. STUDENT

Studies

Movements of the Earth's Crust

ON the question whether the earth's surface has daily undulations or breathings, the following seems a very safe position to take up: namely, that the crust is neither stationary nor limited to any one or two definite motions, but that it is everywhere mobile and liable to fluctuations of various kinds. In fact, when we consider the ratio between the size of the earth's crust and the rigidity of the materials which compose it, we can scarcely regard the word "rigid" as being applicable to it at all. In view of its enormous extent, and of the fact that its materials are not of proportionately greater rigidity, it seems evident that the crust would be responsive to very slight stresses. If the crust is suspended or floated over a mobile interior, then it would compare well with a great lotus floating on the surface of a lake, or a sheet of paper suspended in the air. And, on the supposition that the earth is solid all the way through, still its size and weight would be so great in proportion to its rigidity that we might compare it with a ball of fluff. Again, if we are to consider ratios, then a movement of a few inches, or even a few feet, is so small in comparison with the size of the earth that a proportionate movement taking place on a body of the size of a house would not be detectible by a microscope. Variations of barometrical pressure must surely suffice to produce variations in the level of the crust; and it would be easy to think of many other disturbances which would have a similar effect.

The *Kimberley Diamond Fields Advertiser* says that a regular undulation of the earth's surface is observed at Kimberley and has been under investigation for some years at Kenilworth, where there is an observatory with delicate apparatus. This apparatus has shown that the level rises and falls once (not twice) a day; therefore the movement is not tidal, and would seem to be directly or indirectly connected with the sun. Also the movement is of greater range than 8 inches a day. In addition to this daily movement, there is an

YOUTH IN AGE

YOUTH! for years so many and so sweet
'Tis known that Thou and I were one,
I'll think it but a fond conceit—
It cannot be, that Thou art gone!
Thy vesper-bell hath not yet toll'd:—
And thou wert aye a masker bold!
What strange disguise hast now put on
To make believe that thou art gone?
I see these locks in silvery slips,
This drooping gait, this alter'd size:
But Springtime blossoms on thy lips,
And tears take sunshine from thine eyes!
Life is but Thought: so think I will
That Youth and I are housemates still.

Coleridge

annual one, traceable probably, says the paper, to seasonal rainfall, which makes the whole continent tilt eastward in summer and westward in winter. We may expect that the

indications of delicate instruments will provide us with evidence of many other such local fluctuations; which, however, of course does not conflict with the teaching that the earth has regular movements analogous to breathings. STUDENT

Eucalyptus Possibilities

A GREAT future for the Eucalyptus is predicted in California, both for timber supply and for scenic and climatic effect. The full meaning of the word Eucalyptus can hardly be said to be known here as yet, so many varieties are there in Australia which have not been tried yet. The marvelous adaptability of this tree, and the variety of its species, make it one of the most wonderful plants in existence. In Australia it grows from the snow-clad mountains to the torrid and arid plains, from places where there is 150 inches rainfall to places where there is 7, and from sea-level to 5000 feet altitude. It varies from the giant *Amygdalina*, 500 ft. high and rivaling the Sequoia, to shrubs that will grow in a flower-pot.

The Australians have found it necessary to introduce conservation measures to stop the destruction with which heedlessness threatens even their ample supply, and

to prevent the denudation of watersheds. Undoubtedly the tree is destined to play a large part in converting the barren peaks and wastes of our West into gardens. H.

A Glacial Butterfly

A NATURALIST tells of a visit to Mount Katahdin, on the summit of which was found a new species of butterfly, similar to that found on Mount Washington and supposed to have been left on the mountaintop as on an island, after the glacier had retreated. The nearest allies to the White Mountain butterfly are 1800 miles to the West in the Rocky Mountains; and 1000 miles to the north in Labrador, where the surface conditions are similar to those of these mountaintops. Thus one can assign the ancestry of this butterfly an age of at least 100,000 years. It is a veritable outlier or erratic. E.

A NAKED HOUSE

*A naked house, a naked moor,
A shivering pool before the door,
A garden bare of flowers and fruit,
And poplars at the garden foot,—
Such is the place that I live in,
Bleak without and bare within.
Yet shall your ragged moor receive
The incomparable pomp of eve,
And the cold glories of the dawn
Behind your shivering trees be drawn;
And when the wind from place to place
Doth the unmoored cloud-galleons chase,
Your garden gloom and gleam again
With leaping sun, with dancing rain.
Here shall the wizard moon ascend
The heavens, in the crimson end
Of days declining splendour; here
The armies of the stars appear.*

R. L. Stevenson

Self-Control

THE true student of Theosophy is not merely a reader of books, but one who is endeavoring to put into practice those ideas with which his book study has made him familiar. Moreover, he finds that he never understood the letter until he has tried to assimilate the spirit through sincerely trying to make the teachings a part of his life. The meaning of the "dark sayings" of the spiritual Teachers of Humanity can never be fathomed but by action. The "living truth" must become an actual force of high endeavor and at least partial realization—for the depths of truth are infinite—before we can understand more than the surface meaning.

It is an easy thing to give assent that self-control is a necessary factor in any well-rounded character, it appeals to one's common sense; but it required a Teacher of Theosophy to grasp its full importance and place it in the forefront of the platform of a progressive educational system as we find it done in the Râja Yoga schools today. "The self of matter, and the 'self of spirit can never meet, one of the twain must disappear, there is no place for both," is one of those royal maxims which H. P. Blavatsky left her students; and another is, "Be humble if thou wouldst attain to wisdom." Both of these imply the necessity of self-control.

What is this self we must control? It is the personal man, as opposed to the *individual*; it is all those states of feeling which pertain to the nature we inherit in common with the animals: the love of food and physical comfort; love of fame, that feeling which is all for self in any of its forms, embodying the sense of separateness.

So in gaining true self-control we leave behind the sense of separateness, and feel the unity at the back of all life, and that takes the sting out of existence and deadens beyond recovery the bitterness of a seeming injustice; for each one we meet is then a facet of the

Great Self, one of our "other selves." Knowing the vast importance of self-control is the method by which humanity will eventually find itself from the chains of ignorance.

Katherine Tingley says "the Râja Yoga children are taught the uselessness and folly of anger, pride, and jealousy." Think of our everyday lives, and picture them with these forces held in firm control. Would not the world's life present a different picture, with these three great factors of strife eliminated? It keeps one's heart up, and is well to remember, that large projects and great concerns spring from small beginnings; the meeting in a small room of a few people, started the now immense organization of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY in this age, and the first steps towards self-control may, indeed *must*, begin with the small situations that present themselves in home or office life. We prune our prickles one by one as they appear to us as obstacles to the end we have in view. And what is the real end we have in view that makes effort worth while, and life joyous? It is one of brotherhood, "that men's feet shall be set upon the path that leads to final liberation."

A little practice in this mode of living for the sake of others will cause us to see that the feeling of humility is the *only state of feeling* for a learner, there is such vast wisdom to be assimilated on the path that leads to the Heart of Things, back to a consciousness of our *own* Divinity. It gives one a great reverence for those who "for suffering fellow men" have attained the heights of renunciation, such as H. P. Blavatsky, William Q. Judge, and Katherine Tingley, who in the present age have walked through the valley of the shadow of death to bring us the Light of Theosophy.

"The self of matter and the Self of Spirit can never meet"; one is but the mortal shell or husk, to be broken like the egg, by the living bird seeking the freedom of the larger life. As we learn to manifest the *immortal qualities* we join the ranks of the Immortals, conscious servitors of the Supreme; and the gateway lies through Self-Control. E. I. W.

A Purpose in Life

ONE of the things of greatest importance in anyone's life is to find a purpose.

It is often hard to distinguish between the urge of the lower nature, ambition, desire of recognition, personal interest, envy, and love of reward, and that of the Higher Nature. Yet the urge of the former hardens and contracts one's nature; the urge of the latter opens up and makes flexible one's nature. Thousands upon thousands today of poor humanity are wandering through the paths of life, without any permanent home, without any permanent occupation, without any rest of mind or body. It is this lack of anchorage which makes life so chaotic; makes all the social upheavals in society, all the labor problems, all the strife and turmoil of the masses who are struggling for an existence.

Now, every human being has a Divine Soul which is his Real Self, as pointed out by Theosophy. Every one at certain times in his life, comes face to face with this Soul; it may be when some great calamity falls upon him, when one of his beloved friends dies, or when the opportunity comes for a heroic action. After such moments the whole world takes on a different hue, and one feels refreshed, invigor-

ated, purified, warmed through and through, physically, mentally, and morally. It is at these moments that every one is your brother, rich and poor, strong and weak. It is at these moments that one longs to perform a service for another, however trifling.

Everyone, that is, his Real Self, also has a definite part to play in the affairs of the world. Everyone has an occupation or calling in life, which he should perform; and if one could only find out what this calling or urge of the Soul power was, whether to such a small occupation as making shoes, or digging, or house work, and could hold to it as a service for all, he would never jar with his neighbor. Then there would be plenty of room upon this earth for all, for sustenance of life and liberty of mind. For the Higher Law which guides this universe always works for economy; and in touch with this law one would find that his particular environment suited him exactly, and that in it lay his present opportunity.

Let us then find out this Heart within us, feel its urge, go out among our fellow men, and work, work, work continually for others.

STUDENT

Originality

VERY naturally, considering that Nature everlastingly originates, the true worker aims at originality; but because the source of inspiration is unknown much difficulty is met in the attempt to raise work out of the commonplace, the not-half-bad, the imitative, to honest originality. The self-appointed task may be neither that for which one is fitted, nor that which ought to be done; and only the enlightened can know. The Theosophical worker is given this hint concerning the development of individual genius:

But the wise man also seeketh for that which is homogeneous with his own nature.

Who is so wise? Who is that one who has found his own work?

Is he not the optimist? The happy person thinks creatively; the pessimist continually destroys. Your optimistic neighbor is a constant surprise; he is growing; life renews itself for him with a continuous fascinating interest. Contrarily, the pessimist finds it monotonous, a boredom, where nothing pleasant happens to anybody; where everybody looks glum and says, "What have I done?" and "I'm sick and tired," as though bound by tight oaths to a prescribed form in expressing wounded vanity, jealousy, anger, and despair. Pessimism is marked by its lack of originality.

The optimist is never ordinary. His vocabulary may be restricted, but he speaks a noble language, bestowing his own friendliness, hope, and good will, and this gift sets him apart. You call him original. Well, he has a grain of wisdom for happy, optimistic thought (Theosophically and not sentimentally optimistic) is good thought, and good thought is a valid check on the treasury of pure inspiration.

The optimist comes of the race that stored the treasure-vaults, descended through gods, kings, royal guardians and heroes. In the performance of his last assigned task he re-assumes the important share of the world's responsibility anciently imposed upon him and his line. There he re-discovers "that which is homogeneous," and his craftsmanship becomes very beautiful, bearing the unmistakable distinctive mark of the eternal Man-at-work; inspiring originality.

W. D.

THE MEASURE OF MAN

HE who espouses perfection
Must follow the threefold plan
Of soul and mind and body
To compass the stature of man.

For deep in the primal substance,
With power and purpose and poise—
An order under the chaos,
A mystic beneath the noise—

By loving, learning and doing,
Being must pass and climb
To goodness, to truthful beauty
Through energy, space and time;

Out of the infinite essence
For the eternal employ,
Fashioning, freeing and kindling,
Symmetry, wisdom and joy.

Wherefore, the triune dominion—
Religion, science and art—
We may not disrupt nor divide,
Setting its kingdom apart.

But ever, with glowing ardor
After the ancient plan,
Build the love and the rapture
Into the life of man.

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question It has been said that Theosophy presents a scientific basis for ethics. Please explain this.

Answer If, with Webster, we define Ethics as the science of human duty, and the body of rules drawn therefrom, then, the science of Theosophy and that of the highest ethics are practically identical.

The purpose of the inquiry is evidently just that question which every thoughtful person is putting to himself in these latter days—Where can I find some sure foundation of truth on which to build? How can I assure myself that I am on the right road to fulfil all my obligations, my duty to myself and to my fellows?

In order to answer this question, which is as old as time, the earnest student will spare no pains. He will study the philosophies of ancient wisdom, and he will compare the religions which have swayed the destinies of men and of nations. And if he will enter on the study of this science intelligently, unhampered by previous conviction, and with an open mind, he will find that behind these various formulations of search, endeavor and aspiration, there runs the deep undercurrent of the same human nature, in its dual character of the divine and the earthly. He will discover that man is of one flesh and blood, of one mind and spirit, whatever may have been his caste or creed, and in whatsoever age he has lived and passed away. And so all philosophies and all religions are but the offshoots of the one eternal Theosophic truth which, however veiled, is the mainspring of every one of them.

The teachings of Theosophy as set forth in the writings of H. P. Blavatsky are the revelation of this central truth, now brought to light after ages of obscurity. They show how it was once well known in the temples and schools of the mighty civilizations of the past. In those days there were no speculative Ethics, but there was the science of Theosophy. Its fragments can be detected in the sacred writings which have come down to us, and

the older these are the purer is the teaching. Its signs and symbols are found in every quarter of the globe, and they are enshrined in the allegoric folklore of all peoples.

Within the limits of this short reply, it is of course impossible even to epitomize the teachings of Theosophy with regard to the origin of man and the history of his appearance in the present scattered and widely divergent types. This is all related by H. P. Blavatsky on the authority of those who have preserved the records of these changes. But the science of the races which have peopled the globe from the beginning of time and the statement of ancient Theosophy that these races were and are one in essence, is an important part of the science of man's duty to his fellow.

And in seeking for a scientific basis for duty we cannot forget that we are seeking for that which is more precious than any earthly possession. What does it imply? It implies that we have passed the stage when speculation is of any further avail, and have approached and entered that condition of certainty where the waymarks are unmistakable, and the goal to be reached is occasionally if not continuously distinguished.

Students of Theosophy have found that this certainty of being on the right road can be attained *here and now*. It presents itself in two different ways, each of which confirms the other.

The first of these has already been alluded to. It is that intellectual assent to well proven facts which enables us to perceive the scientific truth which binds together the superb and perfect scheme upon which the universe and man were evolved, from and by the First Great Cause of all beings. It enables us also intellectually to perceive the potentiality which underlies the future, and the means by which this must be attained. This is the common lot of man, and can only come about by his united and harmonious effort. Once these Theosophic ideas have been grasped they unite into a well ordered sequence, the otherwise disordered traditions of all bygone peoples, and by their magic touch they unlock the doors of every ancient myth and legend. The more you study them the deeper becomes your conviction that they are founded upon truth itself.

But there is a further fact which is even more important. There is a second and recondite science without which that of the human intellect would be of no avail. We may intellectually accept a truth; we may gaze upon it, and we may become temporarily enthused by its magnificence and beauty; but it will not be *ours*, unless we make some further effort. We may talk of man's duty to his fellows as coheritors of a common divinity, and yet we may not feel and realize that further experience which is only known by the science of humanity's heart. We may comprehend with our brains, and freely assert, that all men are brothers by divine descent, and yet we may fail to carry out the maxim, He that liveth the life shall know of the doctrine.

The scientific basis for ethics which Theosophy provides for him who studies it in reality by carrying precept into action is that conscious knowledge of his duty to his fellow man which is a vain thing for the greater part of humanity in the present age of material prosperity with its worship of wealth, place

and power. There is a narrow gate which separates the lives of those who live for self, from the lives of those who live for others. For the former, the latter are a mystery, until they see something of the brightness beyond. All true men are approaching that gate, often by winding and devious paths, and many are loitering around the entrance. They see their duty and the glory of it beyond, but they fear to pass on. Those who have passed through it know that on the further side the duty which has hitherto sometimes been a burden, becomes an eternal joy.

Thus there are two ways in which the science of Theosophy, of Ethics or of Duty may be studied. For want of better words we may call these two ways, the Brain-mind and the Heart-mind. They are complementary to each other like Jachin and Boaz. The knowledge of the one may be communicated by words. The knowledge of the other must be sought for in the silence. "He that seeketh shall find." STUDENT

Answer II. A scientific basis implies knowledge verifiable by the facts of experience. Is such a basis for ethics to be found in Theosophy? Following the line of thought presented in the above answer, we may say that ethics is the science of conduct in our relation to our fellows, ourselves, and the universe in which we live. The first inquiry then will be what teachings of Theosophy bear upon this science of conduct in its threefold aspect.

1st. The common origin of all. As said by H. P. Blavatsky in *The Key to Theosophy*, it may be demonstrated

on logical, philosophical, metaphysical and even scientific grounds that: (a) All men have spiritually and physically the same origin, which is the fundamental teaching of Theosophy. (b) As mankind is essentially of one and the same essence, and that essence is one—infinite, uncreate and eternal, whether we call it God or Nature—nothing, therefore, can affect one nation, or one man without affecting all other nations and all other men.

2nd. The reign of absolute law, the law of cause and effect, of absolute justice, which governs not merely the world of physical phenomena, constituting one of the corner-stones of physical science, but rules also with unerring sway the life of man, his thoughts, his emotions, his will, and his acts.

3rd. The method which provides for the complete operation of this law, namely re-embodiment, Reincarnation, which is again an expression of the law of cycles. The immediate question that is before us is, are these statements strictly scientific, are they susceptible of proof through experience, are they borne out by the *facts* of life?

It is manifestly impossible in the short space here available to go fully into the proofs, but these proofs lie open to anyone to test for himself if he will, just as the proofs of astronomy or mathematics lie open to those who will fulfil the necessary conditions—no more, no less. Let the student, however, if he be in earnest, take them as a working hypothesis merely, let him seriously apply them to his life, and he will not find them lacking in any particular. Without them, life is inexplicable as a science; with them, though they may be as yet only imperfectly understood, human conduct is no longer haphazard but founded upon law, i. e., upon demonstrable science. THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l O f f i c e P o i n t L o m a C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

The Panorama of Religion

Diagnosing a Theologian

A CURIOUS conjunction of medicine and theology is brought about by a physician's analysis, in a religious magazine, of the medical aspect of Calvin's theological views. The eminent ecclesiastic seems to have had what we may call a predestinarian diathesis. He could not have helped having the views he had, according to the physician. He was anaemic; and the heart, instead of bathing the brain with rich red corpuscles, pumped thither nothing but poisons. He had chronic blood-poisoning and chronic dyspepsia from his voluntary fasting. His theology was the product of a poisoned brain and a poisoned body, and he calls for our pity.

It is possible to overdo this. Mind and body do act on each other; but the mind is the prime mover. Animals are comparatively free from sickness, though by contact with man they get some diseases along with the benefits they derive.

Calvin's harsh views may have been the result of his diseased body, or it may have been the other way round; Calvin is dead, and we cannot tell now. If his views were deeply intrenched in his mind, it would have been no use curing his body; he would soon have made it bad again. Nor would it be much use curing the body of a person whose mind is determinedly sensual; he would only corrupt his body again by corresponding acts.

But if a person is striving to keep a clean and healthy mind in face of opposition from a diseased body, then it will help him, to cure the body.

Such cases cannot be decided upon by a general law; we need to know the facts in each particular case; and it takes vast insight into human nature and great discrimination to discern all the facts and size them up properly.

To help a disorganized nature effectually one needs to be more than a physician and more than a priest. One must be able to correct his false views of life and restore his hope and ambition; one must be able to point out the errors in his regimen and habits and to assist him with proper medical treatment.

It would be grand to be able to minister to the afflicted in this way. Such a reward lies before the earnest and sincere student of Occultism. Is it not a nobler aim than that of

MEMBERSHIP

In the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

seeking petty things? Think what a deal there is to be learned about human nature; how little do we know of the heart of our most intimate friend, and how powerless, therefore, we are to help him.

A Panegyric on "Genesis" I

THE divergence of clerical opinions of the Bible is so great that the layman may well consider himself at liberty to form an independent judgment, or to choose any set of views he may prefer.

As a contrast to some of the strong denunciations of *Genesis* which issue from the pulpit, we give a brief sample of a panegyric, as follows:

"Genesis" First Chapter

Is it defensible?

I have risen from my study, as complete as I could make it with the materials available for my use, with a profound feeling that this first chapter of *Genesis* is the very Word of God. Call it a series of pictures, if you will, or a vision, or a poem, the form is nothing; the great truths and principles embodied in it, its consistency in its grand outline with the accredited results of science, seem to me to demonstrate its superhuman origin.

Remember that this account of the world's origin preceded by hundreds of years the most ancient writers of Greece or Rome [?]. Moses flourished five centuries before Homer wrote his *Iliad* or Hesiod his *Works and Days* [?]. . . . If this narrative . . . were of merely human origin, would it not, like the other cosmogonies . . . be crowded with mistakes and absurdities? . . .

All that the most microscopic and unsympathetic investigation . . . has been able to do to disparage it is to suggest a few superficial petty difficulties, some tiny flaws, which, even if they were admitted to exist, no more affect the strength and glory of the grand whole than the spots on the sun mar the brightness of the orb of day.

But why does he not mention the second chapter? If he did he would come up against that inconsistency in the two creation accounts. The writer reserves his right to pick and choose among the books, and even the chapters, of the Bible, and to judge their authenticity by internal evidence. Others may do the same and arrive at other conclusions. Authorities are by no means in agreement as to the

consistency, the agreement with science, or even the freedom from mistakes, of this one chapter alone!

Unless we interpret all the sacred cosmic allegories of the various religions as symbolical, we shall have to admit the existence of absurdities in all of them; for they will not bear a dead-letter interpretation. But with

the key to ancient symbology we may understand some of the profound meaning concealed beneath the words of scriptures far more ancient than *Genesis*.

"Decay of Roman Catholicism"

IN the *Daily Telegraph* (London) is a review of a new book called *The Decay of the Church of Rome*, in which the author, writing "with dignity and with an entire freedom from partisan bitterness," brings a powerful array of figures to show that this church has in recent years everywhere fallen off.

The Church of Rome is decaying, and only a dramatic change of its whole character can save it from ruin.

These are his opening words, and the reviewer says they will come as a bolt from the blue to many; for secessions to the Church of Rome are so vigorously acclaimed that most people think they are more frequent than they are. But the author says that at the best, statistics can only be induced to suggest that there are now 250,000,000 Romanists out of 550,000,000 Christians, but even these figures will not for a moment bear examination. During the last fifty years the Papacy has lost not less than a third of its adherents.

Romanism has entered upon a remarkable phase of disintegration.

About 80,000,000 souls must be deducted from the nominal strength of its dominion. Between ten and fifteen millions have been lost in the United States alone during the 19th century, and in the last fifty years 2,000,000 have fallen away in England. The same tale is told all over the continent of Europe; and the decline is not sporadic, but ubiquitous.

The chief cause of this falling away, continues the author, appears to be the spread of popular education, which lets the light of reason in upon the dogma and superstition of the dark ages.

Where a large Catholic population, like that of Ireland or Poland, has been taken out of its narrow groove, and has made acquaintance with other religions, the effect has been disastrous. When a nation

THE THEOSOPHICAL ADDRESS AT ISIS THEATER

A LARGE audience was present at Isis Theater last night to listen to Mr. Kenneth Morris' second lecture on "Theosophy in the Welsh Legends." Besides being a true lover of his native land and its fascinating lore, Mr. Morris has for many years been a close student of Theosophy, first in England and then at the International Headquarters of the Universal Brotherhood and Theosophical Society at Point Loma.

Mr. Morris is a true story teller, and listening to him, so vivid are the word pictures, so poetic is his telling of the old legends, that one forgot the time and regretted the ending of the telling. But here is his own story, read it and enjoy it.

LAST week I had the pleasure of introducing to you the subject of the Theosophy of the old Welsh legends; and, by way of illustrating the method the bards used to employ for teaching the people, made some attempt at interpreting the story of the Wonderful Head, Uthr Ben Ddraig or Uthr Pendragon, the father of the renowned Arthur. Now I should wish, before proceeding, to remind you of the really important things about this study.

You see, it has—or may have and ought to have a greater value than that of mere archaeological research. Some things you can dig up from old records, and they will only tell you dry facts about the ancient peoples. Other records will give you a philosophy from the ancients, which, however, you can get quite as well and a great deal better from the writings of the Theosophical Leaders. But these stories give something else as well; they show the method of teaching which was possible in those old days when men's minds were freer and more flowing and their lives straighter and cleaner and simpler than, alas, ours are now. And this method, I think, cannot fail to be inspiring; with its appeal to one's imagination, to one's sense of the beautiful, the rhythmic, the grandiose. You should note how the bards had certain set phrases, which come sweeping through their stories again and again, till one gets to expect them, in a sense, and enjoy them by anticipation; beautiful and resounding phrases they are, especially if you hear them in the original Welsh. They were put in for very much the same reason as we find rhyme in poetry, rhyme and rhythm; it is because the soul is rhythmic, and works in recurring cycles; it is only where you get the work of the human mind, with its flaunting independence, that you find this regular and musical sweep of things cease to be. The stars move in their orbits, and the seasons follow one another in due order; one spring rhymes with another as you might say, and the fall of one wave rhymes with the fall of the next wave; and the great motions of our souls have the same ordered sweep and grand resonant surge and swell and waning. So this pattern is that of the inner part of our being; it is framed, not in accordance with the daily, commonplace drudges that traffic in our minds; but after the fashion of the deepest part of our nature. . . .—San Diego Union

The Panorama of Religion

(CONCLUDED FROM PAGE 10)

. . . has been liberated somewhat from the mist of dense ignorance, there has been the same disastrous result. The new enlightenment and freedom of the mass of the people is the chief cause of the great revolt in Catholic countries.

The result is that the hold of the Papacy is now chiefly confined to the illiterate public; out of 190,000,000 Roman Catholics, says the author, 120,000,000 are absolutely illiterate.

When we note the extraordinary impotence of Catholicism in the great centers of Europe; when we learn, in country after country, that the middle class forsook it a generation ago, and the artisans are abandoning it today; when we find its authority rejected almost in proportion as a nation is touched with culture; and when we see that its larger tracts of unchallenged authority so constantly correspond with the darker areas in the cultural map of the world—we see that its power rests largely on a basis that is directly and triumphantly challenged by the modern spirit—a basis of ignorance.

So thinks the author, Mr. Joseph McCabe, and, like the reviewer, we may leave the statistics to the statisticians. Apart from churches, whether Roman or otherwise, let us trust that the spirit which fetters the freedom of the human Will and the freedom of the human Intelligence is on the wane; and let us hope that it will not reincarnate itself in some new form—perhaps in the very system which is formed to combat it. When people have more of that higher education which teaches them to know their own sleeping Divinity and to rely on the saving power of their own inner divine savior, they will not need the services of any organization for dispensing salvation, save as an aid to the weak. STUDENT

its first publication in 1888. Naturally, too, it will be found that gaps may be filled from Scandinavian and numerous other sources.

It should not be inferred that the task will be altogether easy, for the period to be covered is enormous. There is one thing, hitherto erroneously regarded as pure "mythology," which may afford a rough guide to the dates of the different epochs alluded to in Irish literature, whether on the Indo-Chaldaic lines, or on those connected with the archaic markings referred to, as well as the two hundred varieties of Ogam. This clue consists in whatever references, whether on stone or parchment, or in tradition, there may be, serving approximately to determine the height of

Lomaland Photo. and Engraving Dept.

TRINITY COLLEGE LIBRARY, DUBLIN

The Gaelic Language Movement---V

MR. DOUGLAS HYDE estimated the number of catalogued pieces in Irish, in the Royal Irish Academy, at about ten thousand, and he added that there are nearly as many more manuscripts which still remain uncatalogued; while another group of them in Trinity College, Dublin, was still without any published printed catalog, ten years ago. Perhaps when such bodies awaken from the dream that the history of anything worth knowing began somewhere about Homer's time, we may hear more of old documents. One thinks of sleeping dragons guarding treasure till the destined tocsin sounds.

From what has been said in previous articles it may readily be imagined that while much of this material, whether in Ireland or scattered throughout Europe, may contain little more than records of petty tribes or clans, on the other hand it will be well worth while to search every line of them for traditions throwing light on the past not of Ireland alone, but of the Celtic and pre-Celtic races in general.

And it may be confidently predicted that as research proceeds, some of the teachings of *The Secret Doctrine*, such as those already briefly adverted to, will be confirmed; just as many have been already corroborated since

giants and other human beings alluded to.

Here it should be kept in view that according to very old records, cremation was universal prior to about 80,000 years ago. This has militated against the discovery, so far, of undoubted human remains corresponding to heights of twelve to twenty feet or more.

The mere fact of men now appearing, from time to time, ten feet high, ought to have suggested to anthropologists that conformably to the law of atavism, or recurrence of ancestral types, there must have been a time when men generally were of that height. Further, as the vertebrates have diminished to from a sixth to a twelfth of former linear dimensions, the inference should be sufficiently obvious that man, the precursor of the animal kingdom according even to the second chapter of *Genesis*, must have done the same.

As a mere matter of fact, certain figures carved out of the living rock among the Hindû Kush mountains, and 8500 feet above sea-level, are imperishable records of the heights (average) of the first three human Root-Races belonging to the present great evolutionary cycle; the fourth being the Atlantean, which ended nearly a million years ago. The largest of these, representing the first (ethereal)

Root-Race, is 173 feet high; the next, 120 feet, stands for the second Root-Race; the third, 60 feet, denotes the average of the third (or Lemurian) Root-Race which "fell," and towards its close separated, or became "male and female," and *physical*. This race, at its close, was only about thirty feet high. The Atlanteans (fourth Root-Race) varied from thirty to about fifteen feet, which brings us to the beginning of the present fifth, or Aryan Root-Race.

Throughout, there would be as at this day individuals and groups, even whole nations, possessing a height double the average, as these great cycles overlap to some extent; so that finally we reach the conclusion that 850,000 years ago there would still be groups of giants 25 to 30 feet in height, among a then general average of 15. It was probably these "giants" to which Murray referred when he wrote that the Mediterranean barbarians

marveled at the prowess of the Atlanteans. Their physical strength was extraordinary (witness indeed their cyclopean buildings) the earth shaking sometimes under their tread. Whatever they did was done speedily.

So also among the Atlanteans, there would be what were to them communities of giants, something like sixty feet in height. And it is to them Hesiod referred.

Clad in bronze from head to foot they passed their lives in fighting. Monstrous in size, endowed with a terrible strength, invincible arms and hands descended from their shoulders.

Such were the giants of earlier Atlantean times. We seem to discern the true period of some events alluded to in Irish tradition and literature.

Truly, folk-lore, epic, and saga, will be found to be far more closely related to FACTS and the heart of things, than the wild and ridiculous catarrhine-ape-ancestor speculations of some modern scientists, who lose sight of the soul in man and its line of descent.

H. P. Blavatsky wrote in 1888 that the present century would not be out of its teens before indubitable evidence would be discovered of the great height of some former human races.

Thus the study of language should go hand in hand with our studies in anthropology and geology, for many are the important lines of thought and investigation which open up while tracing the Celtic back to its roots and beyond.

But there is also an aspect of the Celtic renaissance of the very deepest interest and significance. It has to do with a law, hardly as yet suspected, and which can only be appreciated when some realization of the enormous antiquity of man and the immense sweep of root-racial, sub-racial, and family racial evolution begins to dawn upon us. It is the Law of Cycles, which, like all else, has its origin in the inner, vital, causal, intelligent, and noumenal realms of Man and Nature. This law declares that languages reincarnate, have their periods of growth, perfection, and decay. Language being one mode of soul-expression, under the urge of both experience and aspiration, it is plain these occurrences must be the outcome of soul-needs.

Thus Sanskrit, a perfected language of the last Atlantean sub-race, has during the past million years had its cycles of degeneration and re-perfection, and after having been nearly lost to the world it is again slowly spreading in Europe, and will one day have the extension

it had thousands upon thousands of years back—that of a universal language. Classical Sanskrit was only *restored* by Panini. The vast number of roots common to Greek and Latin had a common Pelasgian source, while Sanskrit roots are also traceable in Greek and Latin, and were likewise from a tongue that preceded the older form of the Vedas. Sanskrit had more than once its rise and fall since Atlantean times.

And the secret of the whole matter is that the direct progenitor of the Vedic Sanskrit was the Vâch, which became the speech of the *inner temples*, and was studied by the initiates among the Chaldeans, Phoenicians, Pelasgians, Etruscans, and Palanquins, in short, by the whole globe. The appellation Devanâgari (the language of the gods) is the synonym of the Hermetic and Hieratic Neter-Khari (divine speech) of the Egyptians.

Here we have at a glance the thread which connects the Celtic language clear back to the days of Atlantis; and at the same time an arresting suggestion of the inner meaning of the Celtic renaissance, as a probable precursor, once more, of the perfected language when man was nearer to the gods. IRISH STUDENT

A Misquotation from "The Secret Doctrine"

IT is getting to be quite a common experience for Theosophists to find in the papers views that bear considerable internal evidence of some occult connexion with H. P. Blavatsky's *Secret Doctrine*. But it is extremely rare to find an acknowledgment of indebtedness to that author and her work.

It was with a feeling of gratification, therefore, that the present writer came across an item in the *Berliner Tageblatt*, signed with the hieroglyphic of a regular correspondent, in which *The Secret Doctrine* is quoted from, and its author named. But alas for the vanity of human hopes! A perusal of the item shows that the quotation has been so altered as to make H. P. Blavatsky seem to countenance the very views she is so strenuously opposing.

In the passage referred to, the author of *The Secret Doctrine* is combating the view that man is only the offspring from an animal stock, and putting forward the view that the semi-animal men and the man-like apes have descended from certain very ancient members of the human family who lost their way and committed bestiality. In the passage as altered by the *Tageblatt*, H. P. Blavatsky seems to countenance the former theory. The signs of her disapproval of these views (in one case an exclamation point, in another case a negative and a whole sentence) are omitted from the quotation; and the balance of H. P. Blavatsky's remarks, thus mutilated, will bear an opposite interpretation to the one she intended to convey.

Below are given the quotations:

ZWERGE UND LEMURIER

Vor einiger Zeit brachte das «Berliner Tageblatt» die Mitteilung, dass der amerikanische Reisende Dr. Geil im Gebirge in der Nähe der grossen chinesischen Mauer einen Volksstamm wilder Zwerge, von dem bisher nichts bekannt war, entdeckt habe. Die Zwerge, deren Körper mit langen Haaren bedeckt waren, flüchteten beim Herannahen des Forschers.

Geil hat damit jedoch keine neue Entdeckung gemacht, denn in der «Secret Doctrine» wird schon von diesem Stamme berichtet. H. P. Blavatsky schreibt ungefähr folgendes: «Von solchen halbtierischen Geschöpfen waren die einzigen der Eth-

nologie bekannten Ueberbleibsel die Tasmanier, ein Teil der Australier, und ein Gebirgsstamm in China, dessen Männer und Weiber gänzlich mit Haar bedeckt sind. Sie waren die letzten gradlinigen Abkömmlinge der halbtierischen Lemurier der letzten Zeit. Es gibt jedoch beträchtliche Mengen gemischter lemuro-atlantischer Völkerschaften, die durch verschiedene Kreuzungen mit solchen halb-menschlichen Stämmen entstanden waren. Zum Beispiel die Wilden von Borneo, die Veddhas von Ceylon, die Professor Flower unter die Arier klassifiziert, die meisten der Australier, die Buschmänner, Negritos und Andamaninsulaner.

Die Australier vom Golf von St. Vincent und aus der Nachbarschaft von Adelaide sind sehr haarig und der braune Flaum auf der Haut der Knaben von fünf bis sechs Jahren nimmt ein pelzartiges Aussehen an. Haeckel versichert, dass diese Rassen die engste Annäherung an den pithekoiden Menschen bedeuten.»

(Translation)

Some time ago the *Berliner Tageblatt* published the announcement that the American traveler, Dr. Geil, had discovered in the mountains in the neighborhood of the great Chinese Wall a race of wild dwarfs of which hitherto nothing has been known. The dwarfs, whose bodies were covered with long hair, fled at the explorer's approach.

Geil has however made no new discovery, for an account of this race has already been given in *The Secret Doctrine*. H. P. Blavatsky writes approximately as follows:

[Original Quotation from *The Secret Doctrine*]

"Of such semi-animal creatures, the sole remnants known to Ethnology were the Tasmanians, a portion of the Australians and a mountain tribe in China, the men and women of which are entirely covered with hair. They were the last descendants in a direct line of the semi-animal latter-day Lemurians referred to. There are, however, considerable numbers of the mixed Lemuro-Atlantean peoples produced by various crossings with such semi-human stocks—e. g. the wild men of Borneo, the Veddahs of Ceylon, classed by Professor Flower among Aryans (!), most of the remaining Australians, Bushmen, Negritos, Andaman Islanders, etc.

"The Australians of the Gulf of St. Vincent and the neighborhood of Adelaide are very hairy, and the brown down on the skin of boys of five or six years of age assumes a furry appearance.

(Original)

They are, however, degraded *men*—not the closest approximation to the "pithecoïd man" as Haeckel so sweepingly affirms."—(Vol. II, pp. 195-6, footnote.

(Tageblatt)

Haeckel affirms that these races imply the closest approximation to the pithecoïd man."

The omission of the sentence, "They are, however, degraded *men*," and, above all, the omission of the denial of Haeckel's view, constitutes an alteration of the text which can certainly not be covered by the word *ungefähr*, which we have translated "approximately." In the quotation, as given in the *Tageblatt*, H. P. Blavatsky seems to countenance Haeckel's view, since she is made to quote it without comment. And it will be noticed that the very significant exclamation point after the statement of Professor Flower's views is omitted in the *Tageblatt*. These omissions may be due to more innocent causes than a wish to tone down or misrepresent H. P. Blavatsky's views; but, in that case, they are very unfortunate omissions. The effect they will produce on readers will be the exact reverse of that which the original writer intended to produce.

It is to be hoped that the *Berliner Tageblatt* will take notice of this serious inaccuracy on the part of its correspondent, by which the credit of an illustrious name is claimed (effectively, if not intentionally) in support of a cause which she expressly confutes.

Art Music Literature and the Drama

Prehistoric Art in Sweden

THAT Art had a real Golden Age in Sweden about 1500 B. C. has been pointed out in the columns of the CENTURY PATH upon several occasions, and as the years pass on archaeologists find more and more evidence of its prominence in the North at that remote time. When comparing the finds now preserved at the Prehistoric Museum in Stockholm, comparatively small in extent as the collection still is, with those from the same period in other countries, they do not hesitate to declare the Swedish art treasures unique and unequalled in Europe. Now and then we realize what an inspiration these ancient things are to those who study them, opening up as they do new and unexpected vistas in the prehistoric life of the nations. The elaborateness of the objects as well as the originality of design prove that a rare feeling for form was possessed by the ancient Swedes, while the skill in execution is such that many of the objects could hardly be surpassed or even reproduced anywhere today, all our boasted progress along all lines notwithstanding.

There is a peculiar atmosphere about these witnesses from olden, happier days that readily touches the beholder. He feels, as it were, that they were made by a people who had a deeper and more real knowledge of life than we have today, whose minds were controlled by the highest powers of the Soul and were therefore calm and able to conceive beauties which to our minds—like the turbulent surface of the sea, as a rule—are presented only in distorted and scattered glimpses. They point to a true and noble aristocracy of life and evoke a real enthusiasm for a *renaissance* of it, and they do it the stronger because they touch the deep and secret chords of the heart. The merely reasoning and arguing mind does not become evident at all until the heart-strings are already vibrating, so strongly are these ancient art treasures still imbued with the atmosphere in which they were created.

From European newspapers we learn that the director of the *Kunsthalle* in Hamburg, Professor Lichtwark, has been traveling recently in Sweden, studying art in general, though especially interested in flower-vases. Speaking of how essential a study of the vase is for a true appreciation of the beauty of the flowers to be contained in it, how the form and color of the vase can enhance their beauty, he relates how often, while on his journey, he found simple common water-bottles without a single ornament used for flowers, their graceful form rendering them ideal for the purpose. And he continues:

To go to Japan and ancient Greece for patterns when studying the forms of vases may certainly not

be called impracticable, but still it is far from sufficient when such a people as the Swedes, from the very dawn of civilization, have brought forth marvelously beautiful and most useful forms. Indeed I can see no reason why we should dispense with the splendid material which science has placed at our disposal in the Prehistoric Museum in Stockholm. Once more I have been studying these collections and once more I have been enraptured by the *sense of form* that the Swedish race has exhibited from the earliest days in diversified works, thanks to an artistically pretentious eye and an exceedingly skilful hand. Here we should study what a

Lomaland Photo. and Engraving Dept.

ZORN'S STATUE OF GUSTAV VASA AT MORA, SWEDEN
(The statue is erected at the very spot upon which Gustav Vasa spoke to his people and aroused them to action resulting in political, economic and spiritual freedom)

profile is and learn how to place a handle or an ear.

In a small depository in the museum we see the most magnificent products of the Swedish bronze-industry from about 1500 B. C.—among other things an ax of such high artistic beauty that even today I do not know the artist or craftsman who could solve the same problem with higher artistic perfection. This beautiful bronze ax, almost totally devoid of ornamentation, can serve as a symbol of the artistic power inherent in the Swedish people, as well as of how they gave expression in everything they did to a strong *manliness*, this constituting such a prominent natural characteristic of that race. And we find the same thing in the prehistoric earthenware.

No people not spiritually enlightened ever yet produced an enduring art, and one expects no less from the land of Vasa, Per Brahe and that wonderful woman, Birgitta. STUDENT

Evidences of a Deeper Search for the Inner Significance of the Shakespearean Drama

ALL signs which point to a closer study of Shakespearean drama, and to a more general awakening of interest in it, are of import to students of Theosophy because of Katherine Tingley's revival of a deeper interest in the Bard's great work some two or three years ago.

One group of enthusiasts is undertaking to make live again the actual pronunciation of Shakespeare's words as it held in the dramatist's own day. While phonetics is a most uncertain guide, and there are probably, in this very group, no two who would absolutely agree upon the pronunciation of all the English words in current use, still a reasonable accuracy will doubtless obtain and the result may be profitable in ways that do not yet appear.

Scenes from *The Tempest* and *Twelfth Night* are to be given. It will be the first dramatic experiment of this kind, and a contributor to the *Manchester Guardian* has been attempting to give samples of what may be expected.

For "one touch of nature" Shakespeare probably said "own tooch of natter," and, very much like a modern Irishman, he would say, "A baste that wants discourse of rayson." It would be "Loov's Labber's Lost" and the "Midsoomer Neecht's Drame." Scraps of *Hamlet* would sound thus:

"A baste that wants discourse of rayson
Would have moorned longer.

Be they as pure (French u) as grass
(grace).

A broken vooice and his whole foonction
shooting (suing)

With forms to his consayt.

To take arms against a say of troobles."

On quite other lines has been the successful production of *Macbeth* under the direction of Maurice Maeterlinck—the bees' brotherly advocate and biographer—with the assistance of his gifted wife and several Parisian actors and actresses of note. The drama, of which M. and Mme. Maeterlinck have made their own version (in French), was presented in the old Abbey of St. Wandrille, Normandy, which dates from the twelfth century and is set in a most picturesque environment. The performance was

unique in that the various scenes were presented in different parts of the Abbey and grounds and all the spectator-guests moved from place to place as scene succeeded scene. A stretch of waste land furnished forth the scenic environment for the "blasted heath" upon which occurred Macbeth's meeting with the "thrice weird sisters," King Duncan was received in one of the cloisters, etc.

Whatever may be one's views as to the merits of this or that effort to make real the life-work of the immortal Teacher-Bard, there can be no doubt that all, in one degree or other, are bringing nearer the day when Shakespeare will be recognized as one of the great revealers of the Inner Mysteries of Life. STUDENT

As a jewel of gold in a swine's snout, so is a fair woman which is without discretion.
Proverbs xi 22

KATHERINE TINGLEY, speaking last year on Types of Women, closed her address with these words: "Put woman in her true place and man will find his." Continually in her teachings she shows the road to this true place by urging her Students to put into daily, hourly practice the Theosophical philosophy brought from the East to Western men and women by H. P. Blavatsky, who declared and wrote that "Theosophy is itself the highest moral code."

Oh, the simplicity, the sheer happiness of life, now and here on earth—as it can be seen in Lomaland—did we not tangle it! And oh, the waste of energy, time, opportunity, and of true self-sacrifice, even of divine inspiration, in the endeavor to escape from our true place through ignorance, blindness, and selfishness!

Life is a battle: "El yo de materia y el yo de Espíritu jamás pueden encontrarse. Uno de los dos debe desaparecer. No existe lugar alguno para entrambos." Phantasy against intuition; therefore, does it not follow, at this period, that a higher evolution depends on woman's right performance of duty and service?

Not but that it is man's battle too; for only by mutual help can the never-sleeping enemy be routed. It is an enemy of old standing and of much experience; protected by ignorance, a mistaken toleration, social custom, by education even; by hypocrisy; and not seldom by ecclesiasticism; and it would retard evolution by asserting, nay, even by demonstrating, that "humanity needs no moral code."

But Katherine Tingley teaches that no lasting edifice can be erected on a shifting foundation, and that civilization's very existence depends upon woman's essential purity. Without it she cannot hope to see God or sense her own Divinity. Therefore, let her search diligently for this "pearl of great price." (Was this the pearl Gautama Buddha had

WOMAN'S DUTY

found and brought to Yaśodhara in one of his prior incarnations?)

Let woman *dare* to look life in the face, to peer into her own heart, to think *for* herself

TO-DAY

WHERE hast thou gone, my Day?

I meant to follow,
Extracting from thine every hour its sweet;
But thou, beguiling hope with pledges hollow,
Art flown on winged feet.

Hardly I greet thy morn,
The glory dwindles;
And as I plan thy moments with delight,
The evening primrose in my pathway kindles
Her taper for the night.

Ah, too precipitate!
Might I not linger
To gather a stray blossom by the way,
But pointing onward with shy, warning finger,
Thou must outstrip me, Day?

Gladly I welcomed thee,
An eager lover
Who deemed he knew each fleeting moment's cost;
Is there no way, no method to recover
The treasure I have lost?

Ah, no! From Time, alas!
One may not borrow;
Nor move him what is squandered to restore.
The tide flows back, and there may dawn a morrow—
Thee I shall find no more.

Florence Earle Coates (Selected)

and by herself, without talk or chatter or outside advice. Honest thought will show her *her* duty and man's needs. Whatever he may pretend—even to himself—life to the average man is not a joke, an automobile expedition, a dance, or a game, but a serious drama; and what he really wants is courageous helpfulness in his efforts to gain self-control. He

seeks the comradeship that will stimulate and appeal to *only* his higher nature; which will brace his armor firmly—how else can he slay dragons?—and send him forth "to redress all human wrongs." Tristan cannot live without Isolde, having once glimpsed her; for he would *like* to wear "the white flower of a blameless life."

And man needs to feel that in his *home* prevarication and temper and moods are *not* inhabitants; that there the gods of love and hope and truth abide; that perfect order and scrupulous cleanliness reign; that a sacred fire burns on the hearth, consuming all disease. Having once caught sight of "Duty's calm, stern face"—duty being defined as "that which is due to humanity"—a wise woman will see that it consists not in rushing madly about or in striving to imitate man.

The wise woman early sees that it may be well, preliminarily, to study her own character, so as to comprehend the meaning of the laws of life and of nature, and then, by living these, to better understand the larger working of the Great Law. She will cultivate the graces of movement, manner, and enunciation. Words as spoken by the educated of any country are music; charm of manner can gain a friend instantly, and experience will teach that it is a life of selflessness which lies behind genuine physical beauty of face and form—that beauty regarded by the ancient Greeks as a gift of the Gods, and more recently said to be the result of moral excellence in many generations of ancestors.

Through such means, and the beauty of self-sacrifice, woman will unconsciously demand and receive, instead of flattery and jewels, man's deeper, more constant love *and his respect*; the two are never separate, for "He needs must love the highest when he sees it." Robert Browning beautifully expresses in his poem *Andrea del Sarto* the deeper needs of man; how, when they are unsatisfied, his work suffers and lacks perfection. And John

Ruskin in *Sesame and Lilies* ("Of Queens' Gardens") pleads with women of rank to enter again the garden of humanity, to weed and keep it, to tie up the drooping flowers and water the thirsty soil.

Why should Queens and Ladies not taste again of the fruit of the Tree of Knowledge pointed out by the Serpent of Wisdom — for the story as told in *Genesis* is sadly misinterpreted. So man and his labor would be ennobled. When the atmosphere of home is true harmony the many difficulties and problems of neighborhood or country will settle themselves; education will be on Râja Yoga lines giving opportunity for the "little white souls of the children" to live and grow.

Together they, man and woman, will realize after long years of pain, that both are links in the same unbreakable chain of Brotherhood. *He*, that woman in her right place is intended to be a guide, a spiritual messenger, through her naturally finer intuition. *She*, that one great duty is to inspire man by her life to understand better the place that he intellectually should occupy in the world's life, and to this end work with him. The world's intellectual life can never evolve on right lines unless both work rightly together.

One of woman's duties is to make perfect men. Together they will discover that "There is no religion higher than Truth"; that Theosophy is this Truth, and includes all the Wisdom of the Ancients, all the philosophies and all the science of the ages.

A Love Letter of Antiquity

A WRITER in the *Corriere della Sera*, of Rome, gives a most interesting account of a love letter four thousand years old, which has recently been unearthed in Chaldaea. It is said to be the oldest of its kind in the world.

To the lady, Kasbuya (little ewe) says Gimil Marduk (the favorite of Morodach) this: May the Sun God of Marduk afford you eternal life. I write wishing that I may know how your health is. Oh, send me a message about it. I live in Babylon and have not seen you, and for this reason I am very anxious. Send me a message that will tell me when you will come to me, so that I may be happy. Come in Marchesvan. May you live long for my sake.

Such is the rather formal translation of the lines which must say many things to the modern reader that they could not have said to the lady of Sippara (the Biblical Sepharvani), to whom they were addressed. For what lightness it breathes over so much that in the study of antiquity suggests only heaviness! And how like is human nature today to the types in Sippara and Babylon (the home of the writer) in the period of 2200 B. C.!

Additional proof is this letter of the fact that the Chaldaean woman of antiquity en-

joyed a respect and freedom quite unknown to her sister of the modern Orient, at least in Mohammedan countries. The difference between the status of woman in ancient and modern Egypt is, as is well known, the difference between day and night.

With regard to similar missives as yet Egypt is silent, though it may be that many a still undiscovered papyrus could disclose as much that is sweet and tender and suggestive of the pure and refining attachments of modern life. For in ancient Egypt woman was man's equal and comrade, his "beloved sister" and his co-worker, and we read a noble and impersonal tribute to ancient womanhood in the Egyptian "Song of the Harpist," probably a festival song, which dates from about 2500 B. C.

Graciously grant us days free from sorrow, Holy Father. Come nearer! Behold, ointments and per-

Lomaland Photo. and Engraving Dept.

fumes bring we unto you; blossoms and lilies do we bring to adorn the neck of your sister — of her who lives in your heart, of her who sits there beside you. Come near finally. Music and song are greeting you. And the days of sadness — these have sunk away and radiant joy is smiling and will smile till the day on which you will pass into the land that loves eternal silence.

STUDENT

In Darkest Africa

THE English novelist and poetess, Miss Charlotte Mansfield, recently arrived in London after a unique African journey from the Cape to Cairo. The trip occupied a period of 218 days, and nearly seventeen thousand miles were covered. The remarkable feature is that Miss Mansfield, whose itinerary included parts of unknown Africa, traveled unaccompanied except by native servants, and often for weeks at a time she did not see a single European or white person.

No white woman had previously made this journey by the same route. Much of it was covered on foot; at other times by means of the *machila*, a kind of hammock swung on poles and carried by natives. In the more remote parts of Africa Miss Mansfield's strange appearance caused much curiosity among the natives, and some alarm, for in

many of the villages visited no other white person had ever before been seen. But nowhere, states this courageous woman, did she meet with the slightest discourtesy or lack of hospitality, and she pays her "uncivilized" brothers the highest tribute for their civility, industry, obedience, loyalty, and intelligence.

During the whole of her journey she relied solely upon her own geographical knowledge of the country, and after leaving Broken Hill she even dispensed with the services of an interpreter. One of the objects of the journey was to investigate and weigh the possibilities of Rhodesia, and of it Miss Mansfield says:

I hope a great Rhodesian artist will arise able not only to depict the grandeur of the scenery, but also the wealth of the colors and bloom lying on every side within one's hand's grasp. Everywhere I find civilization more advanced than I expected. It now only needs individual effort to bring to a

speedy issue the glorious results of the great founder's dreams. It is to be hoped that those now participating in the profits will not lose sight of the original ideals, but, each laying aside party principles and petty interests, will strive to ennoble and beautify the wonderful country they occupy. With regard to the health standpoint, I really do not think that Rhodesia has much to complain of. I have not examined any statistics, but I doubt if fever is as great a scourge there as influenza is in England. STUDENT

"To the Glory of the French Woman"

A FRENCH committee representing art, science, and the army, has proposed that a symbolical statue in honor of French Womanhood be erected in Paris. The plan provides for its erection upon the Champ-de-Mars, near the

Eiffel Tower. It will be of bronze and consist of an allegorical figure of a woman upon a pyramidal base, this to be adorned with bas-reliefs of "Courage," "Devotion," "Self-Sacrifice," and "Purity." It will be inscribed, "To the Glory of the French Woman." H.

Child Marriage in India

SOME startling statistics have been published recently in India on the subject of child marriage, according to a London paper. The number of native wives at present living, who were married under the age of four years is more than 200,000; between five and nine years over two million, and those married between nine and fourteen, about 800,000. In one case recently reported from Kathiawar a man of seventy married a little girl of nine. Child marriage has been condemned, always and unreservedly, by the Leaders of the Theosophical Movement, H. P. Blavatsky, William Q. Judge and Katherine Tingley, all of whom have spoken from personal knowledge gained in India itself. Except for the fact that the leader of a certain cult, which calls itself Theosophical, not long since endorsed child marriage, this statement would be unnecessary, so untheosophical is this cruel custom. RECEPTION TO JAPANESE FROM THE TRAINING SHIP *TAISEI MARU*
IN THE ROTUNDA OF THE RAJA YOGA ACADEMY, LOMALAND

A Visit to Lomaland

ONE beautiful morning toward the end of August, groups of interested young folk of all ages on the balconies of the Râja Yoga Academy in Lomaland, were watching the approach of a body of white-clad men, who were moving along in splendid style to pay a visit to Lomaland. They were the officers and cadets of the Japanese training ship *Taisei Maru* of the Imperial Nautical College of Japan.

As they drew near to the main entrance of the Academy, the young watchers disappeared, and when the visitors arrived at the top of the hill where they were refreshed with cooling drinks and presented with bouquets, the Râja Yoga orchestra was in place and proceeded to play several selections. When all the guests had been escorted into the Rotunda, the orchestra played the Japanese national anthem, while all, visitors and Lomaland students, large and small, stood, thrilled by the presence of a deeper current of patriotic feeling than always accompanies the response to the playing of a national air, for there was something of an intensely devotional nature in the bearing of the Japanese, as the Râja Yoga children sent forth the strains of the anthem.

The address of welcome was an interesting feature of the occasion. It was written and read, in Japanese, by a little Japanese Râja Yoga pupil in his native costume and holding in his hand the flag of Japan, and was responded to in excellent English by the chief officer.

Then came the program of music, including action songs, piano and trombone solos,

ONE TOUCH OF NATURE

A LARK'S song dropped from heaven,
A rose's breath at noon;
A still, sweet stream that flows and flows
Beneath a still, sweet moon;
A little wayside flower
Plucked from the grasses, thus!
A sound, a breath, a glance,—and yet
What is't they bring to us?

Ina Coolbrith (Selected)

numbers by the orchestra, the string quartet, and the chorus of Râja Yoga girls. The graceful movements of the little singers seemed specially to delight the visitors, who were an appreciative audience throughout, and showed plainly that the finer touches so lovingly left upon all work done in Lomaland, were sensed and enjoyed by them. In a circle above the white-clad visitors and children floated the flags of all nations, gracing an assembly thoroughly international in character.

A walk about the grounds followed, and when the party reached the Greek theater, the interest of the visitors manifested itself in inquiries about the work of the Society, and several speeches were made.

The following letter sent by one of the cadets to a San Diego newspaper and quoted from it, indicates that the pleasure of the hosts on this occasion was equaled by that of the Japanese visitors:

Editor San Diego Union:

Will you permit me as a cadet on board the *Taisei Maru* to express the

pleasure which was experienced by all the cadets on the occasion of the reception given at the Râja Yoga Academy yesterday morning when the Japanese anthem was played by the students' orchestra and when the Japanese address was given by the little boy Tetsuo?

It was an agreeable surprise to us to hear the familiar strains of our national hymn played so splendidly by the boys and girls, and we only regretted that they were not able to sing the Japanese words to it. We were all much touched at hearing our much-loved hymn played in concert and by the address spoken in Japanese so far away from home, for there is nothing more moving than to hear one's own language spoken in a foreign land. . . .

Letters in the same strain have been received by the Râja Yoga children, and it is evident that all who were present at this reception feel that a new tie was formed between Japan and the United States on this pleasant summer morning in Lomaland.

THE CHILDREN'S HOUR

Helen's Problem

HELEN came in with a flushed face, tossed her books on the table, and sitting down near her mother, said, "Talk about loving everybody! It can't be done. I have tried liking Hattie Miner for the last time. Mother, your rule won't work. What do you think she said today, just within my hearing? 'Now there is Helen Ames; you all think she is a nice girl, but she does not tell the truth.' Mother, what do you think of that?"

The mother quietly placed her hand on Helen's head and said, "We will talk of this a little later; just now duty calls us to attend other matters, meanwhile let us try to be calm."

Helen's mother had a rare, quiet, deep nature, and while she loved her children, she keenly felt their shortcomings and she knew that one of Helen's was to exaggerate. A bright, quick, thinking girl, full of life and cheer from the abundance of vitality, with a love of fun and an unusual flow of words, she frequently did, in relating an incident or proposing some activity, allow her imagination to enlarge upon the actual facts, with no thought of deceit, but the unguarded overflow of words plainly indicated the extravagance of her thought-habits.

Mrs. Ames was the more sensitive upon this subject because her own brother, as boy and man, had had the same fault. Although a remarkably bright, kind-hearted, and over-generous person, almost a genius — he was so skilful in various ways — despite much home-training this habit clung to him, until in middle life it was his ruin, in his home and before the world; and it was a great relief for her to know that the period had come for Helen to free herself from it. She had found that in guiding Helen, if she could discover her own fault and be led to consider it, that in a short time she had herself well on the road to self-control. Not long before this, Helen's mother had said, "My daughter, give attention when anyone you do not like criticises you or when those with whom you are not in harmony allow you to see what they think of you. You can learn in this way. Your friends may be less critical of your failings or less willing to speak plainly of you."

Helen had been thinking of this on her way from school and in the hours while their duties occupied their hands, so when the time came for them to talk it over she said, "Mother, I can see that Hattie was not so far from the truth in what she said of me. Tell me how to guard against this habit of exaggeration."

The mother had been feeling more deeply than ever how much we need to realize that thought does precede our speech and acts, although we may not be conscious of it. She had taught Helen that the imagination is a soul trait, and righteously used is a glorious aid, but insisted that as with all good things, its abuse was its dark side.

"Mother, how can I help it? Words run

Lomaland Photo. and Engraving Dept.

"Hopefully through danger stride:
Never fear;
Truth will be a noble guide—
Persevere.
With a free and willing hand,
With a brave and cheerful heart,
With the true and toiling stand,
Striving to act well your part;
Persevere."

riot in my head and rush to my tongue."

"Yes, Helen, that is just it, a riot, and while it is better to have too many thoughts than too few, it is our duty to decide which shall remain and be cultivated, and which ignored or expelled."

"Well, Mother, I suppose I must apply your 'cure all' to this bad habit."

Mrs. Ames' "cure all" was to be silent for a day or a week or a longer period, if the occasion required it. To be silent was not to be sullen, far from that, in the Ames home; it meant to be silent except when spoken to or when occasion called for remark, and meanwhile to think calmly and persistently on the subject under consideration. So successful had it been that it was now called "Mother's cure all," and so much had it done for each of the children that all had come to respect its

season when it became evident that any of them were working out some problem.

Often no one but the one in fault and the mother, knew, and sometimes with the older ones it had become a habit formed, so that many little matters were settled as Gertrude expressed it one day, "by my Soul and me." Helen began next morning to guard her words — but first her thoughts — and to hold strictly to actual facts in every statement. Great was her surprise to learn how difficult it was. Before the week was ended she began to consider Hattie Miner a friend. At the end of the second week she held counsel with her mother, and at the end of a month she said, "Mother, I believe I have kept to the bare facts in every statement this past week, but oh, what an uncontrolled mind I have! Shall I ever, ever, control it?"

The mother felt the battle already won, for when Helen once attempted anything seriously she never gave up; so she could heartily say, "Keep up your aspiration and your fight; permit not one discouraging thought and the victory is yours."
J. H. H.

Sowing Seeds of Universal Brotherhood

IF you were to peep through one of the windows of the beautiful building where the Râja Yoga boys have their classes, some sunny morning, you would see some of these wonderful seeds being planted. This is the way they are doing it. There is a group of little boys seated, as if in class, and there is a professor in charge of them, giving a lesson. At first you might think it was playing at school; and they all look so happy and interested that they seem to enjoy the game. But it is a Japanese class, and the tiny professor is a Râja Yoga pupil. He is teaching his little comrades the Japanese alphabet. The very day he came they began to wish to know some words of his language. How could they help feeling that way about a little comrade? Another seed was sown the first day they heard him sing the Japanese national song.

Little folks are always greatly interested to hear different stories about the children of other countries, and to look at pictures of their homes and games, but it means much more to them to have playmates belonging to different countries and speaking different languages. You know some of the beautiful stones for the arch on the Temple Hill in Lomaland were brought from far-off lands to represent these places in the International Headquarters. But now there are happy little children coming from all over the world to learn Râja Yoga, and one cannot help thinking that something very beautiful will be built for the world from their lives as joyous little comrades in the Râja Yoga School. They learn to love one another, to speak one another's languages, to sing one another's songs, to be glad in the joy of others, and to long to help suffering wherever it is to be found. And all of them are learning together to find the Warrior — the shining Soul, who will do battle against the wrong in the world. GENTIAN

THE MYSTERIES OF THE HEART DOCTRINE

PREPARED BY
KATHERINE TINGLEY
AND HER PUPILS

The Theosophical Book *of the* Twentieth Century

Tells the story and the history of the Theosophical Movement.

The prices are \$2 in cloth and \$1 in paper, which barely cover the cost, for it is printed and bound, not gaudily, but with such carefulness and thoroughness of art and craft as to make it unique among modern edition books.

ORDER FROM THE
THEOSOPHICAL PUBLISHING CO., POINT LOMA, CAL.

Isis Conservatory of Music OF THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY POINT LOMA, CALIFORNIA

SOME OF THE ERRORS OF CHRISTIAN SCIENCE CRITICISM

BY H. P. BLAVATSKY AND WILLIAM Q. JUDGE

CONTENTS

"The Empty Vessel Makes the Greatest Sound"
A Note of Warning

—by H. P. Blavatsky

Of "Metaphysical Healing"

Affirmations and Denials

The Cure of Diseases

Replanting Diseases for Future Use

—by William Q. Judge

A MOST VALUABLE PAMPHLET. Outside of Theosophy there is given no adequate explanation of the healing that is at times accomplished, nor of its *rational*, nor of the ultimate price that must be paid and the dangers connected with such practices.

This pamphlet is invaluable to all students.

What is Individualism?

THE doctrine of "social evolution" tells us that government should interfere as little as possible in human affairs, and that then the race will progress of itself through the competition of individual wills, the unfit being eliminated, the fit surviving.

Some people believe that this doctrine is all right; others are sure it is all wrong and will lead to chaos.

The reason for this wide difference of opinion is that in formulating the doctrine, no distinction was made between *Individuality* and *personality*. Ordinarily these two words are used interchangeably and wrongly; but for the purpose of clearing up the difficulties it is necessary to give them different meanings. They will therefore be used in the following remarks in the senses applied to them in Theosophical writings:

The *personality* must be understood as meaning the selfish will of man, that which strives to promote his (supposed) personal interests; his selfish desires, in short. It is the false "self"; and, in contradistinction —

The *Individuality* is the real Self; the Spiritual Will; that which promotes the man's true interests; that which inspires his unselfish aspirations and motives.

The difference is the same as that between the lower and the Higher nature of man. A certain difficulty in defining the limits of these two powers arises from the fact that they are blended together in the human mind, which is the battlefield of contending forces.

Now it is clear that if society is to be left to the striving of selfish wills, the result will be discord and destructive strife; and the so-called "fittest" who survive will be merely the most selfish. The tendency will be in the direction of a retrogression and degeneration, the violent destructive forces will gain the upper hand, civilization will give place to barbarism; and finally, if there be no check, will come extinction of that particular race. We have not far to look among the races of the world in order to find instances of this process.

On the other hand, if by "individualism" we mean the principle of allowing free action to the Individuality — that is, to the Higher nature of man — then the result will be progressive and constructive; the destructive forces will be checked; selfishness and passion will be subdued; the "fit" who survive will not be the most selfish or the richest or the physically strongest, but the worthiest, the noblest.

It is therefore necessary to define more

clearly what we understand by "individualism," when we are either advocating it as a blessing or decrying it as an evil; for so long as the meaning remains vague, including both the lower and the Higher self, we cannot call it either good or evil.

Many people seem to be afraid that their individuality will be interfered with; and here again we meet with the same confusion. For the real Individuality *cannot* be interfered with, and that which is interfered with is the personality. Personalities conflict, because they represent conflicting desires and separate

"interests"; but by the term Individuality we have agreed to understand the Higher nature of man, and this prompts only to harmony and unself-

ishness. People who make such a fuss about their individuality do not act as if they had much real faith in it. Everybody is at liberty to assert his Individuality, and nobody can hinder him; but if it be his selfishness that he intends to assert, then he is certain to meet with opposition.

We do not seem to realize the importance of our individual acts. It may seem humiliating to a person who is proud of his individuality to be told that he does not show a due sense of his own importance; but it is true. If we had a proper sense of our own importance we would be more careful of our acts. But these people who insist so strongly on their own importance seem as if they prized the credit more than the actual possession, and considered their importance needed advertising for fear people should fail to notice it.

Individuality means the power to act boldly and independently in accordance with our principles; the determination to do what we feel to be right, regardless of criticism; and, above all, the conviction that our acts, when performed in such a spirit, will be potent forces for good in the world. Anyone who says that his acts will not count is deficient in a sense of his own importance; he lacks individuality.

False teachings have sapped the individuality of people by making them believe that they are miserable sinners, or higher animals. The consequence is that we have all forgotten our actual possessions and are clamoring for what we call our "rights"!

Theosophy says that every man is a potential Christ; and that by virtue of this innate Divinity, he is able to be an immense power in the world. But he must act according to the laws of nature and not contrary to them; he must use the *Spiritual Will*, not the selfish desires. So long as he merely exercises his selfish desires, he is not using the Higher

forces, and his acts will not count for much. But when he sets aside the pullings and pushings of his personal desires, and resolves to follow principle, then he invokes the Spiritual powers in him, and they are virtually infinite.

Personality
is Petty and
Self-Seeking

Discontented fanatics who are out of tune with their fellows and who frantically proclaim the glory of man's free will, jeering at all moral laws, have mistaken the personality for the Individuality. If it be real freedom they seek, they need not clamor for it, for it is theirs by inalienable right. But if it be license that they seek, then what can be their object in teaching this gospel to others, whose desires would conflict with their own? They are bewildered and unbalanced and know not what they do.

The clamoring for supposed rights is always accompanied by an abrogation of real rights; we know what to think of the man who is always praying for opportunities. If it be true in the business world that the man who uses his opportunities gets on, while the man who is always waiting for a better time or seeking an easier kind of work fails; it is true in life generally. The strong man is he who knows the value of his actual possessions, and values his own character and Individuality; the weakling is he who refuses to use what he has and asks for what he has not.

Individuality
is Immortal;
Personality
Evanescence

A man who should resolve to assert his Individuality would soon become a great influence, felt all around him. His acts and opinions would acquire a new weight. His sphere of influence would rapidly extend. Moreover there are invisible channels by which his influence would spread in Hertzian waves through the ether of thought. His thoughts and acts, so long as they were enlightened and unselfish, would have far greater power because they would be on a higher plane. In proportion as he extricated himself from the trammels of personal desire he would gain the power of vision and the power of independent and influential action. This is the true Individualism; this is the real Self-assertion, when a man no longer asserts his selfish personality, but asserts the true Self; when he refuses to be a slave to his animal nature, and follows the laws of his Higher Nature. STUDENT

Halley's Comet

HALLEY'S comet is an excellent time-keeper; it has arrived punctually after its enormous journey of about 75 years into the abyss of space outside the orbit of Neptune, the uttermost planet known to us. It was first picked up by Professor Wolff at Heidelberg, on September 11, and has since been seen through the great Lick telescope. It is a very faint object at present and will not be visible to the naked eye for several months. Next spring it will probably be a fine spectacle in the early morning hours.

Halley's comet was seen in Europe as long ago as B. C. 11, when it hung menacingly over Rome for some weeks preceding the death of Agrippa; but it was recorded by Chinese astronomers in the years 87 B. C. and 250 B. C. It has returned twenty-seven times since the latter date and has generally caused great consternation from its formidable appearance. Halley's comet has always had the reputation

of being the forerunner of hard times for the poor, and as it appeared several times immediately before very serious events in the history of the world, such coincidences must have given encouragement to the general belief in old times that brilliant comets have something to do with stirring up things on earth. We believe that they do.

Halley's comet is pictured in the famous Bayeux Tapestry, which represents the conquest of England by William of Normandy. It was firmly believed to be connected with that event. Of it in 1456, Draper says:

So tremendous was its apparition that it was necessary for the Pope himself to interfere. He exorcised and expelled it from the skies. It slunk away into the abysses of space, terror-stricken by the maledictions of Calixtus III, and did not venture back for seventy-five years!—*Conflict between Religion and Science*, chap. x

From a scientific standpoint this comet is perhaps the most interesting of all these mysterious visitors from the unknown, for its appearance in 1682 gave the celebrated astronomer, Edmund Halley, the editor and publisher of Newton's *Principia*, the opportunity of computing its orbit accurately on the plan suggested by Newton. This laborious task completed successfully, Halley soon discovered that the comet, which has since been called by his name, had appeared many times before, and he instantly saw that it should be possible to predict its next appearance. This he did, saying:

Wherefore if it should return according to our prediction about the year 1758 impartial posterity will not refuse to acknowledge that this was first discovered by an Englishman.

Halley's comet reappeared Dec. 25, 1758.

The last great comet seen by our generation came in 1882. It was so brilliant that when it passed nearest the sun—within less than half the diameter of the solar orb—its brightest part was clearly visible in full daylight. As it was only visible in the early morning, comparatively few persons saw it.

Other comets have approached still nearer the sun; that of 1843 appeared almost to graze its surface, being estimated at only 32,000 miles away when closest.

Whether Halley's comet will or will not attain remarkable brilliancy this time remains to be seen, for it is supposed to be customary with comets to lose a goodly portion of their substance while in the vicinity of the sun. The tremendous forces radiating from the sun arouse a corresponding activity on the part of the comets, which proceed to develop their tails as they approach the sun. Their closer-woven portions blaze out in luminous electric discharges. A repulsive action exerted by the sun, partly electrical and partly caused it is supposed by astronomers, by the pressure of light, drives the subtler particles of the tails away from the "heads," which, in fact, lead a very fast life under the unwonted stimulus, as they rush by the sun at an almost incredible speed. As they depart into quieter regions of space their speed and feverish activity diminish, the vapors condense, and they settle down into ordinary stellar humdrum existence. But as they lose a good deal of their substance during their gay life, the next time they return they show a reduction in size and brilliancy. Some comets have split up and finally disappeared after several journeys round the sun.

Now that it is considered proven that a comet is a focus of tremendous electrical

forces, perhaps it may not be so unscientific after all to suppose that a specially large and brilliant one may produce some powerful effect upon the earth's magnetic condition, and thereby on some of its inhabitants. STUDENT

Chemical Symbols and Ancient Symbols

AT the British Association meeting, the president of the chemical section, Professor H. E. Armstrong, dwelt on the importance of the element carbon in chemistry, and especially emphasized its relation to the tetrahedron. It has four affinities operating in the directions of the four radii from the center to the angles of the tetrahedron.

Nothing is more surprising than the completeness with which the vast array of facts included in organic chemistry may be ordered by reference to the tetrahedral model. In the future, when our civilization has gone the way of all civilizations, and strangers dig on the sites of our ruined cities for signs of our life, they will find the tetrahedron and the benzene hexagon among the mystic symbols which they have difficulty in interpreting. If, like the ancient Egyptians, we made our tombs records of our wisdom, such symbols would long since have acquired sacred significance, and the public would probably have learnt to regard them with awe and to respect them as totems. Chemists might at least wear them on aprons in imitation of the Freemasons. Perhaps no two other symbols have so great a significance; they reach into life itself.

But the strangers would have no such difficulty in interpreting the symbols, for these symbols are ancient and universal. The benzene hexagon is Solomon's Seal over again; the tetrahedron is one form of the Quaternary and Tetraktys, Pythagorean symbols. The professor may say that such symbols have "acquired" a sacred significance by being engraved on tombs; but they were sacred apart from that, and were engraved on tombs because they were sacred. The celebrated Pythagorean Tetraktys consisted of ten dots arranged pyramidally as one, two, three, four. This symbol was a summary of evolution. Along with other geometrical symbols it was used by the pupils in the schools of the Mysteries as a means of recording the instruction of their Teachers; for these figures—to those who can read them—

are more eloquent and scientific descriptions of the order of the evolution of the Universe, spiritual and psychic, as well as physical, than volumes of descriptive Cosmogonies and revealed "Geneses." (*The Secret Doctrine*, vol. I, p. 612)

There is nothing arbitrary about the geometrical symbols; they are based on facts in nature; and this about the carbon atom illustrates the point. The Number of Spirit was 3, the Number of Matter 4; the two together making organic Life. Organic chemistry shows us the four principal elements to be Carbon, Hydrogen, Oxygen, and Nitrogen; the Carbon atom is fourfold in its qualities, as shown. The number 6 is related to the number 4, as we see in the relation between the square and the cube. The structure of matter is on a cubical plan, when not on a hexagonal plan; rocks cleave cubically and hexagonally. Instances might be multiplied of the omniprevalence of the number 4 in connexion with Matter, together with its companion number 6. Our four elements are Carbon, Hydrogen, Oxygen, and Nitrogen; Fire, Air, Water, Earth, were the terms employed by other generations. The number of different fourfold categories is infinite.

Some Views on XXth Century Problems

The Karma of a Fence

THE new one-volume Bible Commentary, edited from Queen's College, Cambridge, aiming to give its readers the product of the best conservatism and the most valid newer Criticism, naturally dwells most upon the points of maximum sceptical attack.

But it is never noticed that these points, at which so much work of defense has had to be done, would never have been in need had it not been for collective ecclesial intolerance. Despite the advances of science, the scepticism of our time need never have developed. It is the retribution of intolerant egotism, ignorance, and bigotry.

The current of belief in "miracles" was as wide as human thought. Mankind had never doubted that the will of its greatest and most spiritual, transcended, in its power over nature, the common will; and the belief rested on and grew entirely from the completest evidence.

But the miracles within the field of Church history were presently fenced about; within the fence were the only real ones; outside, the records of their precise counterparts evidenced only popular superstition and infantile credulity. And now the few within have proved too few to stand alone.

The same with inspiration. Only within our Church were there men with moral height enough to enter the divine world, be touched with its fire, and become its message bearers. So the divine world is far too thinly evidenced and belief in it is lessening every day.

The symbol of the virgin birth is everywhere in time, the (re)-birth of the purified human soul into and from the sea (Mare) of divine light, Isis. If the peoples personified and carnalized the symbol, it is no more than the Church did. And so that which in its universality would have been compellingly obvious as a profoundly philosophical and mystical symbol, in its isolation falls from the weight of its materialization.

The simple task of Theosophy is to take away the fence. STUDENT

Welsh Theosophy

WALES offers a fine opportunity for the study of the aftermath of a "Revival."

In 1904 one of these phenomena blew into flame everywhere, reached its height, and died away. What, if any, was its permanent result?

A Welsh clergyman has supplied us with the answer:

The national life at the present hour is profoundly tainted by religious discouragements. It penetrates every pulpit, every church, and every parish in the land. . . . The whole attitude of the people towards the Bible has undergone a deplorable change, and the change is both rapid and widespread. No one conversant with the inner life of Wales can fail to observe the alarming spread of the personal and domestic disuse of the Bible. This is true even in the case of those who are religiously disposed.

But are the "discouragements" of the people or the pulpits? For the Rev. Mr. J. Vyrnwy Morgan does not maintain consistency with his own statement. He says that this so "discouraging" Revival nevertheless

brought the conviction home to the people that there is a rich spiritual life that may be, under certain conditions, revealed and utilized for the enriching of the individual character and the upbuilding of the Heavenly Kingdom,

despite the "disuse of the Bible." How does this conviction reconcile itself with the aforesaid "discouragements"?

The traditions and some of the ritual of a great mystical system of philosophy, Druidism, are yet extant in Wales, and the spirit of it is deep in the hearts of the people. It has been no more entered into and understood by modern writers upon it than has the mysticism of ancient Egypt. Like that, it has been studied from the reports and interpretations of early Christian bigotry, and treated as a manifestation of the half savage childhood of the race. It was one of the Theosophies of Celtism, one of the descendants of that primeval Aryan Theosophy which received a more and more partial presentment for every succeeding epoch of civilization, corresponding to the slowly materializing consciousness of the peoples. But the real Druidism was not far from the root. Our scholars, having lost the interpretation of myths and symbols, and having no conception of the possibility of civilizations that were as spiritual as ours is material and which have therefore left little trace for the archaeologist, have not yet reached the heart or mind of a single ancient creed.

The old pre-Christian spirit is stirring in Wales and even in England, as the recent pageants show, manifestations of the vitality of the deep buried past, half blind attempts to get back little by little, to get away from the iron weight of today. The cycle of that past is coming again and it was to meet it that H. P. Blavatsky rendered some of ancient Theosophy into terms of modern thought.

STUDENT

Will and Mechanism

PROFESSOR SODDY recently pained some of his scientific confrères by suggesting that in some far prehistoric past there were secrets of nature known and used of which we are now groping in rediscovery.

The knowledge of some of these secrets is credited in legend and tradition to the lost Atlanteans; of others, to abnormally developed men of every time. But the traditions say nothing of apparatus, and apparatus is the very essence of our far-away imitations.

The legends credited the "magician" with the power to see what he would, at any time and at any distance, by mere effort of will. An extraordinarily complicated apparatus has just been invented which, by means of selenium, electricity, mirrors, and the rest, enables this thing to be imitated.

The magician could project his etheric form so as to be seen and heard where he would. This same apparatus accomplishes in some degree the first of these two phenomena; wireless telephony the second.

The magician could make his will materially effective at any distance. We have gotten this far, that a boat can be guided a considerable way out to sea by wireless electric transmis-

sion to its machinery, applied from the shore.

The magician could raise a boat into the air and navigate it, himself within. We have as yet no apparatus for suspending or reversing gravity and have to affix complicated motor machinery to aeroplanes or balloons.

The magician, especially the Atlantean magician, could make gold of baser metals. His will was evidently regarded as the chief factor here also, for we have no mention of apparatus in the oldest legends. We are beginning to get within sight of transmutation, but we shall certainly need all possible apparatus.

It can of course be maintained that there never was a magician people nor individual magicians and that all the traditions represent merely the wild imagination of the race child.

Or it can be maintained that the legends and traditions are echoes from an almost utterly lost civilization in which the will of man functioned as it does not now; that as Professor Soddy suggests, he misused his power and his knowledge of nature's secrets and lost both; and so with a shallower and more objectively working intellect now has to do with apparatus what he should be doing otherwise. STUDENT

The Astral Tablets

IN his comments upon some of the Mrs. Piper phenomena, those purporting to be due to the spirit of the late Hodgson, Professor James advances what he calls *Fechner's* theory of a world-memory on whose tablets whatever has been done on earth is reflected and held.

There is such a memory, but it was known and written of long before Fechner. It was — by way of a late European example — fully described by Paracelsus, who gives instructions for making a mirror, which would, he said, facilitate contact with its pictures. It is the *Astral Light* of Theosophy. The mind of a medium, withdrawn from the ordinary objective world, may lose its own identity amid a number of such pictures and in a confused way imitate the dead personality whose deeds they register. But the contact is shaky and uncertain; other and quite unrelated pictures may be accidentally touched; various shells beside that of the dead personality may be present; and the whole is mixed with the memories and preconceptions of the sitters and medium.

The theory, taken only as such, will correlate and explain so many phenomena that it cannot wait much longer for general adaptation. Besides doing its share in the explanation of spiritualistic phenomena; it will cover those cases of constantly re-enacted scenes — mostly horrible — that become visible and audible to sensitive persons in certain haunted houses. It covers the phenomena of psychometry or "trace," and of seeing at a distance. For astral space, like astral time, is as it were telescopic and not at all according to the space and time in which the brain and senses work. Dreams are often astral pictures, as well as the hallucinations of some drugs. Some cases of causeless crime are hypnotic effects of intense astral pictures getting into the brains of negative, sensitive, semi-criminal men. C.

Palaeontology

Ethnology

Palaeontology: Science Vindicates Theosophy

THEOSOPHY has everything to welcome in facts. Wherever it finds itself in conflict with scientific opinions, it maintains that these opinions are not founded on the facts, and that the facts will later on vindicate Theosophy. It is the part of the CENTURY PATH to cite many instances of this process; and at present palaeontology affords the opportunity to do so.

Professor A. S. Woodward, in his address to the Geological Section of the British Association, showed how the wealth of facts we have recently discovered have conflicted with the theories advanced in days when far fewer facts were known; and he has replaced these theories by views which approximate in many respects to those taught by Theosophy. Thus he has vindicated the claim that Theosophy rests on fact, and that science approaches the closer to Theosophy the more it relies on the facts and eschews hasty speculation. He said:

Modern systematic researches are continually complicating, rather than simplifying, the problems we have to solve. . . . Every advance in the study of fossils reveals more problems than it solves.

For instance, when a group of animals is confined to a small region, it ought to be easy to trace the lines of descent. The primitive horned hoofed animals of the family of *Titanotheriidae* are only known from part of North America, where they originated and remained until the end. As the fossils are abundant, it ought to be easy to discover the connexions between the genera and the species. But Professor Osborn has proved that the *Titanotheres* must have evolved in at least four distinct lines. Their ramifications are so numerous that the possibility of following chains of ancestors appears nearly hopeless. Again, twenty years ago it seemed likely that we should find the terrestrial ancestors of the *Ichthyosauria* in the Trias. But we now know from the California Trias a multitude of reptiles which need more explanation than the *Ichthyosauria* themselves. "We are embarrassed by the richness of the sources whence we may obtain the ancestors of mammals."

The Professor has also shown that *races appear suddenly from elsewhere, fully formed in certain localities*, and that after they have once appeared, the subsequent modifications they undergo are slow and slight. Also that races grow old and die. Following are some quotations, with our italics.

Speaking of the persistent progress of life to a higher plane, he says:

Palaeontologists are now generally agreed that there is some principle underlying this progress much more fundamental than chance-variation or response to environment, however much these phenomena may have contributed to certain minor adaptations.

This is an important admission, especially when given as the view of palaeontologists in general. The facts have revealed the presence of design and order in the universe; chance and blind forces are no longer considered adequate. To believe in such things is superstition—contrary to the facts. See what W. Q. Judge says below, about Nature needing aid. As to the vertebrata:

We are not likely ever to discover the actual ancestors of animals on the backbone plan, because *they do not seem to have acquired any hard skeleton until the latter part of the Silurian period, when fossils prove them to have been typical and fully developed*, though low in the backbone scale.

Fishes were already well established and distributed over perhaps the greater part of the northern hemisphere at the beginning of Devonian times; and then there began *suddenly a remarkable impulse towards the production of lung-breathers*, which is noticeable not only in Europe and North America, but also probably so far away as Australia. . . .

The *Stegocephala* or *Labyrinthodonts*, as these primitive amphibians are termed, were therefore a vigorous race; but the marsh-dwelling habits of the majority did not allow of much variation from the salamander pattern. Only in the Upper Carboniferous and Lower Permian times did some of their representatives (the *Microsauria*) become lizard-like, or even snake-like, in form and habit—and then there suddenly arose the true reptiles. . . .

In short it is evident that the progress of the backbone land animals during the successive periods of geological time has not been uniform and gradual, but has proceeded in a rhythmic manner. There have been *alternations of restless episodes which meant real advance, with periods of comparative stability*, during which the predominant animals merely varied in response to their surroundings, or degenerated, or gradually grew to a large size. There was no transition, for instance, between the reptiles of the Cretaceous period and the mammals which immediately took their place in the succeeding Eocene period; those mammals, as we have seen, had actually originated long ages before, and had remained practically dormant in some region which we have not yet discovered, waiting to burst forth in due time. . . . *We do not understand the phenomenon—we cannot explain it.* . . .

The demonstration by fossils that many animals of the same general shape and habit have originated two or three times, at two or three successive periods, from two or three continually higher grades of life, is very interesting. To have proved, for example, that flying reptiles did not pass into birds or bats, that hoofed Dinosaurs did not change into hoofed mammals, and that *Ichthyosaurs* did not become porpoises; and to have shown that all these later animals were mere mimics of their predecessors, *originating independently from a higher yet generalized stock*, is a remarkable achievement.

He then shows that races show towards the end of their career marks of old age, one of which is the growing to enormous size, and another the exaggerated development of certain features until these become a hindrance. Also to the rapid disappearance of whole orders of animals, which had a world-wide distribution at the time when the end came.

Changes towards advancement and fixity which are so determinate in direction, and changes towards extinction which are so continually repeated, seem to denote *some inherent property in living things*, which is as definite as that of crystallization in inorganic substances. The regular course of these changes is *merely hindered and modified by a succession of shocks from the environment and Natural Selection*. Each separate chain of life, indeed, bears a striking resemblance to a crystal of some inorganic substance which has been disturbed by impurities during its growth. . . .

Even when a group of animals seems to have been confined to some comparatively small region . . . modern research still emphasizes the *difficulty of tracing real lines of descent*. The primitive horned hoofed animals of the family of *Titanotheriidae*, for example, are only known from part of North America, and they seem to have originated and remained there until the end. As their fossil skeletons are abundant and well preserved, it ought to be easy to discover the exact connexions of the several genera and species. Professor Osborn has now proved, however, that the *Titanotheres* must

have evolved in at least four distinct lines. . . . The ramifications of the group are indeed so numerous that the possibility of following chains of ancestors begins to appear nearly hopeless. . . .

Now compare all this with what is taught in Theosophy. William Q. Judge says in *The Ocean of Theosophy*, pp. 130 et seq.:

As man came to this globe from another planet . . . so the lower kingdoms came likewise from other planets, and carry on their evolution step by step upward by the aid of man. . . . The general forms of the various kingdoms being so brought over, we have next to consider how the differentiation of animal and other lower species began and was carried on.

This is the point where intelligent aid and interference from a mind or mass of minds is absolutely necessary. Such aid and interference was and is the fact, for Nature unaided cannot do the work right. But I do not mean that God or angel interferes and aids. It is Man who does this. Not the man of the day, weak and ignorant as he is, but great souls, high and holy men of immense power, knowledge, and wisdom. . . . They are the *Dhyānis*, the Creators, the Guides, the Great Spirits. . . .

By methods known to themselves and to the Great Lodge they work on the forms so brought over, and by aiding here, taking away there, and often altering, they gradually transform by such alteration and addition the kingdoms of nature. . . . This process is carried on chiefly in the purely astral period preceding the gross physical stage. . . . When the midway point of evolution is reached the species emerge on to the present stage and not showing the connexion to the eye of man nor to our instruments. The investigations of the day have traced species down to a point where, as is confessed, it is not known to what root they go back. . . .

A vast period of time, about 300,000,000 years, was passed by earth and man and all the kingdoms of nature in an astral stage. Then there was no gross matter such as we now know. This was in the early rounds when Nature was proceeding slowly with the work of perfecting the types on the astral plane. . . . At the end of that stretch of years the process of hardening began.

To conclude: it is evident that the Theosophical teachings afford the real clue. The fact that the main types are formed on the astral plane, and then appear on the physical, is borne out by Professor Woodward's remarks about the Silurian mammals. What he says about environment and selection being a minor influence bears out the teaching about the influence of the *Dhyānis* in molding forms. His unknown laws and untraceable influences are simply these Minds at work. The Theosophical teachings may seem too far-reaching, but every day they are confirmed. They are founded on fact, and the more Nature is studied, the more they will be vindicated.

The study of Nature shows that it is indeed most elaborate and complicated. To reach the truth by the method of induction would seem almost hopeless; the more so when we consider the limitations of our ordinary means of observation and reflect how very many essential facts must lie outside the range of those faculties. But are we under the necessity of elaborating a whole cosmic theory *de novo*, as if nobody had ever studied the matter before? Theosophy answers, Study the ancient cosmogonies, too often unceremoniously dismissed as mere fables, and perhaps you may find the clues to a more comprehensive knowledge of natural laws and principles than that which we possess in our age. STUDENT

✧ The Trend of Twentieth Century Science ✧

The Newer Zoology

FORTUITOUS variations pruned by Natural Selection, were for many years almost unanimously credited as efficient and sufficient cause of evolution.

Biology seems to have outgrown that view. Such a cause could at best produce adaptation to environment, not ascent. And the pruning knife of Natural Selection is often found failing to remove even positively injurious variations. A few instances of this failure were recently given by Dr. Woodward in his address to the Geological Section of the British Association at its last (Winnipeg) gathering.

It appears, indeed, that when some part of an animal . . . began to grow relatively large in successive generations during geological time, it often acquired some mysterious impetus by which it continued to increase long after it had reached the serviceable limit. The unwieldy antlers of the extinct Sedgwick deer and Irish deer just mentioned, for example, must have been impediments rather than useful weapons. The excessive enlargement of the upper canine teeth in the so-called sabre-toothed tigers, must also eventually have hindered rather than aided the capture and eating of prey.

And so on. Why did omnipotent Natural Selection not check these growths the very moment they passed the point of utility? Dr. Woodward suggests something of an answer, though very cautiously:

I am, therefore, still inclined to believe that the comparison of vital processes with certain purely physical phenomena is not altogether fanciful. Changes . . . which are so determinate in direction, and changes towards extinction which are so continually repeated—

(He had been dwelling upon the unexplained extinction of certain wide groups, not due to competition, nor to failure of adaptation, nor to any other operation of Natural Selection's pruning knife)

seem to denote some inherent property in living things, which is as definite as that of crystallization in inorganic substances.

The "inherent property" is to run through a cycle of manifestation, even in the teeth of Natural Selection, and to cease such manifestation when the cycle is completed, even when Natural Selection would permit continuance. The monads have exhausted the possibilities of experience in that particular set of forms.

Rejecting fortuitous variations as the cause of ascending evolution, Dr. Woodward ventures to speak of an "intense struggle" upward:

I wish especially to emphasize the interest and significance of the persistent progress of life to a higher plane which we observe during the successive geological periods; for I think palaeontologists are now generally agreed that there is some principle underlying this progress much more fundamental than chance-variation or response to environment, however much these phenomena may have contributed to certain minor adaptations.

Speaking of the Theromorphs he says that

The majority of them very quickly became so closely similar to the mammals that they can only be interpreted as indicating an intense struggle towards the attainment of the higher warm-blooded grade;

and he refers to

an intensely restless early community of reptiles in which all the variations were more or less in the right direction for advancement.

These struggles were rhythmic, not uniform and gradual. One of them would take place at a particular point on some line of types, resulting in some wholly new type. Further along the same line the effort would be repeated, resulting again in that new type, but now more perfect. The phenomenon might occur a third time; and then some biologist of the old Haeckel school would arrange the three varieties of the new type one above another, explaining that fortuitous variation had gently evolved the third from the second and the second from the first. Says Dr. Woodward:

The demonstration by fossils that many animals of the same general shape and habit have originated two or three times, at two or three successive periods, from two or three continually higher grades of life, is very interesting. . . . There was no transition, for instance, between the reptiles of the Cretaceous period and the mammals which immediately took their place in the succeeding Eocene period: those mammals, as we have seen, had actually originated long ages before, and had remained practically dormant in some region which we have not yet discovered, waiting to burst forth in due time.

Owing to these sudden movements of the life impulse, its equally unexplained quiescences, and other causes, the orthodox genealogical tree with its gentle and regular passages from branch to stem, from stem to twig, cannot be legitimately constructed. There are hiatuses everywhere.

When we turn to details it must be admitted that modern systematic researches are continually complicating rather than simplifying the problems we have to solve. . . . Even when a group of animals seems to have been confined to one comparatively small region . . . modern research still emphasizes the difficulty of tracing real lines of descent. . . . Among early reptiles the same difficulties are continually multiplied by the progress of discovery. . . . Serious difficulties have also become apparent during recent years in determining exactly the origin of the mammals. . . . During the last two decades the progress in our knowledge of the extinct backboned animals has been truly astonishing. Whole groups have been traced a long way towards their origin; but with them have been found a number of previously unknown groups which complicate all questions of evolution to an almost bewildering extent.

Dr. Woodward points out that the actual origination of the backboned animals is entirely unknown.

We are not likely ever to discover the actual ancestors of animals on the backboned plan, because they do not seem to have acquired any hard skeleton until the latter part of the Silurian period, when fossils prove them to have been typical and fully developed.

The Theosophical explanation of the gap difficulties is not likely to be accepted at once, but its acceptance may not be so far away.

Our globe has had three chapters or editions of its history before this one, at each edition solidifying its material from conditions we should call etheric or astral. In this fourth edition it finally became solid matter. Through the third it was perfecting the radical animal types. When this period opened, these evolved types began to condense from the etheric to the solid and to be inhabited by the life monads again. The transitional types, through which these final ones had been reached, had disappeared, and the latter therefore constituted definitely separated steps. After the passage

of these "basic astral types" (vide H. P. Blavatsky's *The Secret Doctrine*, Vol. II, p. 738) into the physical, they began to vary, and the variations to be variously dealt with by the forces of their environment. These variations are in some cases adaptations to the environment, in others real steps of formal (following on functional or vital) progression. New subtypes therefore appear, some of them filling the gaps between the basic types, some branching in fresh directions. It is the latter, and the unfilled gaps, that constitute the perplexities of those biologists who pin faith to the Haeckelian genealogical tree.

But H. P. Blavatsky's own work must be consulted for a fuller account. STUDENT

Tricks With Plants

WE have more and more ways for compelling the plants to do what they do not want to do, for depriving them of much or all of their rest between flowering times. The explanation of each method singly is very difficult; less so if they are all considered together.

It was observed that fruit trees, much heated (but not exactly scorched) by a neighboring fire, bloomed as soon as they had recovered. Upon that fact depends one of the methods. Chloroforming or etherizing plants will make them flower. In certain cases freezing will do the same. Properly used electricity will also do it.

The most recent trick is warm water, water at about blood heat for eight or more hours, only the leaves (if any) and the stems and shoots, being immersed.

The secret is evidently the placing the plant under extremely abnormal conditions, removing it before the irritation has begun to *kill* the cells. But the plant must certainly suffer in some way. STUDENT

The Electric Sign of Protoplasm

A REAL difference between animal and vegetable protoplasm seems to have been discovered, enabling the lowliest one-celled organisms to be placed on one or the other side of the line.

Whenever a current, alternating or direct, is passed through water containing elongated cells, they arrange themselves with their axis in line with it. But when the current is in one direction only, the distinction between animal and vegetable becomes visible. Animal cells move against the current, that is, towards the positive pole, the vegetable ones selecting the opposite direction. When both kinds of cell were present, the sliding effect of the two streams past each other was very marked. Not only did the cell as a whole move towards its favored pole, but its protoplasmic contents moved within it in the same direction, occasionally becoming so enthusiastic as to burst the wall. It is therefore inferred that animal protoplasm has the negative sign (because moving toward the positive pole) and vegetable protoplasm, drawn to the negative pole, the positive sign. The effect of magnets does not seem to have been tried. STUDENT

Nature

Studies

Graz

GRAZ is a peaceful nook at the foot of the Styrian Alps in the broad, fertile valley of the Mur 1500 feet above sea-level. The picturesque old houses are dominated by the Schlossburg with its clock tower, seen to the right of the picture. The town is well supplied with public pleasure grounds and holiday resorts and is the center of a brisk trade and manufacturing industry.

The Colorado Desert

THE *National Geographic Magazine* for August, publishes an article on the Colorado Desert, by W. C. Mendenhall, of the U. S. Geological Survey.

In California nearly every type of environment in which man exists is represented. Its thousand miles of territory along the Pacific passes from tropical to temperate conditions, from the most arid to one of the most humid sections on the continent, and from the elevation of 14,500 feet at Mount Whitney to the lowest point on the continent at Death Valley 276 feet below sea-level. Often extremes are in close juxtaposition, and the flower and fruit garden of Southern California is only 100 miles from a region, originally one of the most desolate spots on the globe, with officially recorded temperatures of 130°, but now destined through irrigation to become a unique agricultural section.

The desert valley is an extension of the Gulf of California, which arm of the sea formerly extended 200 miles further inland than now. The mouth of the Colorado River was then near Yuma, Arizona; and presumably the river carried then, as now, enough sediment from the cañons of Utah and Arizona to cover one square mile to a depth of 53 feet. Building a delta across the Gulf, its stream became divided into two parts, one discharging into the ocean, the other into an inland sea. It continued to deposit sediment along its course, thus elevating its bed above the plain, and, by occasional changes of course, gradually building up the plain and making the delta lands of the Imperial Valley. It has since discharged itself alternately into the sea and the Salton Sink.

The last time it emptied into the sink is indicated by a well-preserved old water-line, showing the shore of the ancient lake, around the desert, 40 feet above sea-level, with deposits of calcium carbonate. At a very rough estimate the writer suggests 1000 years ago from geological considerations; but adduces some Indian traditions in support of a more recent date for the existence of the lake. It was on account of the recent irrigation works that the Colorado River burst through a canal and began again to flow into the Sink. Much

land was submerged and property destroyed, and the reclamation work suspended; but, although a large lake has been formed, engineers have succeeded in stopping the danger of further overflow.

The aridity of this region is such that sometimes a year or more passes without a drop of rain, and the annual average for many seasons is less than 3 inches. The native vegetation includes the ocatilla, spiny barrel cactus, cholla, palo verde, ironwood, and here and there clumps of greasewood or gray sagebrush.

Within or about the borders of the desert are weird and varied land formations. East of Holtville is a zone of sand dunes 12 miles wide and 50 miles long; in the western edge of the Imperial Valley are bad lands equal in picturesqueness and uselessness to those in Dakota. The rare torrential rains have carved in the bordering mountains gorges sometimes scarcely wide enough at the bottom for a man to pass, yet with walls 200 feet high. But among the most incongruous features are two groups of mud volcanoes. The best of these is now submerged by the Salton Sea. The craterlets of mud look like dilapidated bee hives, with cup-shaped depressions in the tops, from which, or from vents in the sides steam and other gases are continually rising. The condensing sulphur lines the vents with yellow crystals and round about are pools of hot mud. The second group of solfataras is about 40 miles south of the Mexican boundary, covering many acres, many of them boiling and

bubbling continually and covering the surface with weird hues, white, yellow, red, or orange, from the sulphides. STUDENT

Natural Weather Signs

A FARMER who has been disappointed with the predictions of the Weather Bureau has come forward as a champion of the old-fashioned homely signs among the ants, bees, spiders, and trees; and when we consider how many of these signs there are, it seems as if it might be worth while to cultivate the art of reading them more.

A bee is never caught in a shower, and

When bees to distance wing their flight,
Days are warm and skies are bright;
But when their flight is near at home,
Stormy weather is sure to come.

When ants quit their homes for other quarters and travel in lines, expect fair weather. If they scatter it is going to rain.

If spiders are indolent rain will soon follow. Their activity during rain is proof of its short duration. If they quit their webs this is also a sign of rain. When you see the ground covered with spiders' webs which are wet with dew and there is no dew on the grass, it is a sign of rain before night, for the spiders "are putting up their umbrellas." But others say: "When spiders put up their sunshades it will be a hot day."

The fragrance of flowers is more apparent just before a shower than at any other time.

Cottonwood and quaking trees curl up their leaves before a rain.

When the leaves of the sugar maple are turned upside down expect rain.

Clover leaves also turn up preceding a rain. Corn fodder dry and crisp indicates fair weather, but when damp and limp, rain. STUDENT

The Bible, a Chapter in the Wisdom-Religion of the Ages

THEOSOPHY vindicates the truth of many portions of the Bible which have been too lightly laid aside by modern scepticism as a mere collection of legends gotten up by primitive ignoramuses. Theosophy agrees with Paul in believing that many of the strange narratives of the Old Testament are allegorical, and it shows that they are more than pegs upon which to hang moral teachings.

Theosophy gives the key to deeper meanings hidden behind the exoteric forms of the world-religions and proves that the national epics of Greece, Scandinavia, Ireland, etc., are based on the one universal primitive Wisdom-Religion.

Modern scholarship is fairly unanimous in thinking that *Genesis* is largely composed of sundry scraps of legend and tradition with perhaps a little authentic history, and that it was pieced together by some unknown editor. There is an edition of the Bible in which the patches supposed to be from different sources are printed in different colors. The effect is picturesque but not necessarily correct, for the interpretation brought forward by H. P. Blavatsky reveals a very different state of things, and clears up most of the apparent inconsistencies.

Properly to understand the difficulties which have puzzled so many acute minds, let anyone who may never have tried the experiment take the Bible in hand and read the first few chapters as if they were quite unfamiliar. Read them critically as if they were from the Egyptian *Book of the Dead*, or the Greek story of creation by Hesiod. Note the apparent contradictions, the singular repetitions, the special use of certain names, such as "God," "Lord," which appear to be used indiscriminately, but are not.

It will be noticed, firstly, that there are two quite different accounts of the origin of man. Chapter 1—called the "Wet" account by scholars—speaks of a pre-Adamite race which evolved *after* the plants, the fishes, the birds, and the beasts. No mention is made of Adam or Eve by name, or of the creation of Eve from the rib, and the narrative closes with the sabbath blessing in the third verse of the second chapter. According to Theosophy this is a simple and condensed account of the early conditions of the earth and its inhabitants before the present order of physical life in matter had been instituted.

The second account begins immediately, and is altogether different. In this—the "Dry" account—the plants could not grow, partly for want of "moisture," though they were waiting ready. Adam appears, now the complete man, composed of the dust of the ground, the breath of life, and the living soul, a rough epitome of the Seven Principles of the Eastern Teachings. Adam is alone at first, without even a dog for companion, for the animals were not yet formed. Eve is then separated from Adam, who then gives the animals their names, i.e., endows them with something they had not before; and immediately follows the misunderstood story of the Fall, and the significant statement that the Lord God made clothes of skins for the complete man and woman. When clothed, i.e., fully developed physically, and separated into two sexes, humanity is sent out from the Garden of innocence and ignorance, to learn its lessons in the outer world and

to earn the bread of life, spiritual and physical, by labor. It—or we—had eaten of the Tree of Knowledge, but not of the Tree of Life, which has been protected from the unworthy ever since by a flaming sword. We have to find our way back to the Garden of Eden at last with the added knowledge and strength of character gained through the trials of our long pilgrimage through many incarnations.

The first story says nothing about the Fall, the second says nothing about the creation of the universe, of the sun and moon, or of the ordered periods called "days." These and many other details are of great interest from the Theosophical position, for they are precisely what ought to be there to harmonize with the other records of Theosophy contained in non-Jewish religions and philosophies.

Looking once more at the two chapters, you cannot help noticing that the word "God" is exclusively used in the first narrative, and "Lord God" in the second. This in itself ought to make the thoughtful reader suspect there is something more than appears on the surface. The word God is used for the plural term "Elohim," the higher creative Powers. "Jehovah," one of these divine powers, translated "Lord God," is a more limited expression, implying duality, the manifestation of the active and passive principles in lower planes, the separation of the sexes. The wise teachers in Palestine, as in Egypt and India, found it necessary to distinguish clearly between the higher and the lower workings of the Divine Spirit, and so they invented different names for the various forms of its action. In Egypt and India this was carried, in later times, to an excessive degree by the exoteric priests.

The Higher Criticism has concluded, in the absence of real information, that the apparently inharmonious accounts in *Genesis* are simply two independent legends pasted together by some scribe who could not tell which was the more correct, and who thought the safest thing was to keep both.

Much as we may admire the wonderful skill and patience of the eminent scholars who have raised the towering edifice of modern Biblical criticism, in the matter of the Creation stories at least, they are wide of the mark, for by comparing them with the other creation legends in the light of Theosophy, they take their rightful place as brief outlines of *different* and *successive* processes of evolution in the great work of the formation of complete man, "the image of God." But neither science nor theology has yet realized that evolution includes infinitely more than just the building up of the body, the lowest of the complex vehicles for the soul.

The Theosophical system of Evolution is much more comprehensive than the Darwinian, for it includes the spiritual, the psychic, and the mental, and explains factors in man's make-up which are yet unrecognized by science, though that ignorance cannot last much longer. The records in the possession of H. P. Blavatsky's Teachers go far back of the earliest civilizations known to archaeologists, though the recent frank admission by science that the human skull lately found in France must be at least 400,000 years old is encouraging.

The key offered by Theosophy is no make-believe; it is qualified to open the doors of all the world-scriptures, and as it reveals the same hidden wisdom in them all—though of course in varying degree—we are justified in calling it the master-key. We say to earnest inquirers: Break through the Chinese Wall of prejudice and calumny that ignorance and bigotry have raised round the extraordinary being known as H. P. Blavatsky, and study Theosophy for yourselves.

While the clergy have been helplessly watching the crumbling of their creeds, independent scholars and scientists are beginning to advance theories based on new facts which would have been regarded as outrageous a few years ago, and yet which are simply partial approaches to the truth, to Theosophy. Professor Soddy, the eminent Scottish chemist, for

instance, has been brought by his researches into the terrific forces locked up in the atom to believe it probable that a high civilization existed in pre-historic ages. He thinks it likely that science was then well acquainted with forces whose existence we are only just beginning to discover, and that civilized mankind was mainly destroyed by their misuse. In support of this he instances such things as the story of Atlantis, and the universal traditions of Golden Ages and world-wide destructions of the wicked. It is hardly necessary to say that H. P. Blavatsky devoted a large portion of *The Secret Doctrine* to the demonstration of the truth of this very idea.

We find in *Genesis*, in the story of Noah's flood, a condensed account of the destruction of Atlantis, and the race preceding ours, with its "giants," and "mighty men of renown," followed by the rebirth of civilization. There are many little touches of detail in the early Biblical narratives which are generally supposed to be merely parts of the exoteric form of the story, such as the tragedy of Abel, the drunkenness of Noah, the deep sleep of Adam, and others. These are really proofs of the great knowledge of the writers, for Theosophy shows the inner meanings of all of them in such a convincing manner than we can recognize them in the other world-scriptures, even, in some cases, under different forms.

It is impossible even to refer to a large number of the Theosophical teachings openly or secretly given in the early books of the Bible, so the Theosophical story of Solomon's Temple building, and the Book of *Job*, with its account of the dramatic representations in the Initiation of candidates into the Ancient Mysteries, and the trials of the neophytes which preceded the ceremonies, must be passed by.

It is a necessary inference from the general principle of Reincarnation that there must be some persons who have far outstripped the general average in attaining perfect control of their personalities and uniting themselves with the divine Self. Such great ones who have become the Helpers of all that lives, are frequently mentioned in the Bible. Moses was such a one, an Initiate in all the learning of the Egyptians, it is said. Then came the splendid roll of Prophets, the spiritual leaders of the people in contradistinction to the formal, orthodox priesthood, whom they frequently denounced. The Prophets came down from their mountains, or from their so-called Schools, where they had been illuminated by the inner Light, and like Jesus, they always spoke with authority, for they had that real knowledge which is beyond the reasoning of the brain mind. Here and there we get distinct proofs, not only of their immense spiritual development but of their knowledge of the universal Wisdom-Religion, Theosophy. When it was necessary they showed the possession of supernatural power over the forces of nature, and they clearly knew the language of symbols which is enshrined in the Jewish Kabala, the mystic book which conceals the deeper meaning of many parts of the Bible. For instance, Ezekiel describes in his vision four winged creatures in the blazing wheels. They had faces like unto a man, an ox, a lion, and an eagle. This symbol was repeated by the author of *Revelation* (chap 4). It is a widely spread symbol of the awful divine forces behind the elementary kingdoms of Air, Earth, Fire, and Water, and is found throughout the Orient and elsewhere. According to H. P. Blavatsky, an acknowledged master of the Kabala, its secret meaning can be traced under nearly all the apparently simple narratives of the Old Testament, and in the *Revelation* of John.

Later came Paul who speaks of himself as a "wise master-builder" which signifies much to those who know the fullness of meaning covered by that term. The central feature of his teaching is the Theosophical teaching that the real life is only to be attained by the union of the purified personality with the divine inner Ego, the Christos. In his own words he "travailed that Christ be formed in you." It is noteworthy that Paul never speaks

of the personality of Jesus. The story of the miraculous birth, the miracles, and the portents at the crucifixion, seem to have been unknown to him; he always speaks of the Christos as a divine principle which dwelleth in every man, "the power and wisdom of God," and he constantly urges his hearers to seek within themselves for the higher Light. His word-picture in the xiii chapter of *I Corinthians* is one of the most impressive descriptions of the impersonal life of the true disciple in all literature. It is absolutely pure Theosophy—pure Brotherhood—and if it had been acted upon during all these weary Christian centuries the world would be a very different place today. What Paul's secret teachings were we can only guess, for he says he only spoke the deeper wisdom amongst the "perfected," the initiated.

Throughout the whole Bible we see that there was an inner meaning, but Jesus, and after him, Paul, make it perfectly clear that the deeper teachings could only be given to the trained disciples. There is nothing harsh or exclusive about this from the standpoint of Reincarnation. A wise old saying, "Discipline must precede philosophy," applies here, and when the pupil is ready we always find the Master is ready. It is in the Law, that you cannot receive that which you have not deserved. Christ came firstly to preach the fundamental belief of Theosophy, i. e., Universal Brotherhood—"all things whatsoever that men should do to you, do ye even so to them; for this is the law and the prophets."

In teaching Brotherhood Jesus necessarily enforced the principles of Reincarnation, and Karma, the law of justice, that "whatsoever a man soweth that shall he also reap." In the wonderful and terrible picture of the Last Judgment in *Matthew* 25, Jesus makes this so plain that it seems extraordinary how the pernicious doctrine of Vicarious Atonement—of salvation by some outside influence—could have crept in and masqueraded under the name of Christianity. He shows there that nothing but the spirit of pure love for humanity, pure Brotherhood, can count a feather's weight in the final adjustment. Jesus offers no back door to peace and joy; he was terrible in reproof. Reincarnation is plainly taught in *Revelation*, where it is said that those who overcome shall no more go out from the house of the Lord, etc.

One more word about the hidden historical teachings in the Old Testament. Why should students of Theosophy attach importance to the right understanding of these facts; why should H. P. Blavatsky and William Q. Judge have taken such pains to show us how to read a few chapters of the mystic scroll of antiquity? Surely it is clear that a true knowledge of our past will teach us what to avoid and what to seek. H. P. Blavatsky says in the opening chapter of *The Secret Doctrine*:

In this age of crass and illogical materialism, the Esoteric Philosophy alone is calculated to withstand the repeated attacks on all and everything man holds most dear and sacred in his inner spiritual life. Esoteric Philosophy reconciles all religions, strips every one of its outward human garments, and shows the root of each to be identical with that of every other great religion.

Time will necessarily be required before those whose minds are attached rather to the outer form than to the inner spiritual meaning can break down their personal feeling or pride in thinking they possess the only true faith; but if it be true that our race is leading the world in material and intellectual progress, what a splendid opportunity we have to lead the nations to a real understanding of the Brotherhood of religions, a Brotherhood in which each would have its place in the harmony as the most suitable vehicle for its own adherents, and yet in which each would acknowledge the good points of the others, rejoicing that all were roads to that Truth which underlies and is greater than all forms. That is what we mean by the motto of the Theosophical Society, "There is no religion higher than Truth." C. J. R.

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question What do you think is the right attitude for a student of Theosophy to take in regard to the failings of others? For instance in the lines:

If we looked for people's virtues,
And their faults refused to see,
What a comfortable, happy,
Cheerful place this world would be.

Would it be right to do so? Is it the right attitude of a true friend, to

Be to my virtues ever kind,
And to my faults a little blind?

I am puzzled over the question, and would like to have it discussed in the Theosophical Forum.

D. E.

Answer The rule might be laid down, that in every instance one should decide for himself in which direction the right lies; but that most of us would promptly decide all wrong; judging by the wrong criterions, and with the wrong end of judgment.

There is undoubtedly that within us which might dictate to brain and feelings in all these matters, and that from the standpoint of ultimate knowledge. The soul has its eyes fixed eternally on one goal, which is the end of human evolution, and can see what action will coincide with its chosen course, and take it; but we have not made ourselves at one with the soul, and do not act with its wisdom, nor are inspired with its magnificent hope and determination. We have to remember that in all our problems there are various idle, proud, and clamorous good-for-nothing voices making themselves heard within us; we have enfranchised them and given them the suffrage; and their vote shall be polled, they claim, and have equal value with that of the soul.

Indeed, can we distinguish this kind of voice from that? Since the days when King Soul was deposed, and dubbed affrontingly "Citizen," and even crowded out from the polling booth by this upstart mob of pride and passions; have we not grown indiscriminate of our inward demagogues, and prone to put up with the loudest and most insistent? Beware, then, of the voice that bids you step in, and do some little correcting on your own account, of this or that failing which you see in your brother. Not yet has the old injunction grown forceless, that we shall cast out first the beam which is in our own eye; hypocrisy is a grand mark of the lower nature; and the improver of others is commonly a little tainted with the leaven of the Pharisees.

"A little blind" says the wise and kindly couplet; by no means blind altogether; by no means letting oneself be used by the lower nature of another for its own deterioration. But insist first on the virtues; respond to and take hold upon them. The man you are tempted to look down upon is also a divine soul; he too, came out of the bosom of the Infinite, and has circled time and the worlds, and journeys upon the quest of quests. Not the least superiority is yours, unless you have forgotten superiority, and remember nothing but your duty of service to the world. Oh, how our very virtues do encumber us; what a load and burden upon us, often, are the good things and abilities to which we may have attained. These too are possessions, if considered so, which make a Dives of their proud possessor; and it is still hard for a rich man to enter into the kingdom. Strip them off, says the

teaching; divest yourself of interest in them; value them only in so far as they qualify you.

The best man is he who uses his goodness, and is in oblivion of it; he recognizes, with the eye of his divinity, the divinity in all men, even in his own friends and nearest acquaintances; and all his actions are towards that divinity, and guided by it.

A man comes to him boasting, and we can well imagine his action. I do not think he will begin any smug sermon on the folly of conceit, or plan some humiliation for the boaster. Such a course he will leave to the Pharisees; for him, probably, there will be an unmoved silence, and turning to his nearest duty. In such action there will be yet a rebuke which, by its impersonality, is bound to penetrate; it will speak much louder than words, and convict the fool of his folly. The boaster hears the Pharisee, and breaks out,—Who are you to sermonize to me? Are you perfect? Do not your own words convict you of a smugger vanity than mine? I am an injured man; I am unjustly treated: I must go forth and proclaim my virtues louder than before. But at the silence of the true man he is apt to pause; and if he says anything, it will be,—I believe I have been making a fool of myself again. A most salutary thought to be in his mind, and one that shall better him, and not confirm him in his folly.

Yet no absolute formula can be given. The Pharisee could easily imitate the good man's silence, and only condemn himself the more deeply with it. The higher and more perfect an action may be, the worse it is when used wrongly, and for the glorification of self. The one maxim absolute is this, that we should unclasp ourselves of egotism, that we should live resolutely to benefit mankind, and erase every other motive persistently. No mode of action is right always; but compassion is always right.

But should we allow wrong to be done? Are we to stand still when the wolf is in the fold, or be influenced by compunction towards the rattlesnake? We need no better guide than common sense here. Go in and strike hard and home; that will be the performance of your duty.

Compassion does not work for the world's disadvantage, under any circumstances or at any time. She goeth armed and bright-sworded against the enemies of men. But there is a world of difference between those who are actively and consciously evil, and the run of us who are well-intentioned, but very faulty.

STUDENT

FALL not however into the common prevaricating way of self-commendation and boasting, by denoting the imperfections of others. He who discommendeth others obliquely commendeth himself. He who whispers their infirmities proclaims his own Exemption from them, and consequently says, *I am not as this Publican*, or *Hic niger*, whom I talk of. Open ostentation and loud vainglory is more tolerable than this obliquity, as but containing some Froth no Ink; as but consisting of a personal piece of folly, not complicated with uncharitableness.

When thou lookest upon the Imperfections of others, allow one Eye for what is Laudable in them, and the balance they have from some excellency, which may render them considerable.—*Sir Thomas Browne*

THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l O f f i c e P o i n t L o m a C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

The Churches

The "Institutional Church"

A PAPER describes an institutional church in Chicago. On the roof-garden of a church the writer saw rows of chairs for the congregation, an auditorium below them, while within were a series of lounging and smoking rooms for the men on weekday nights, apartments for the women's clubs, nurseries, a gymnasium, a dancing club, etc. Lectures with stereopticon views are given, and sermons in many modern languages; medical attendance, legal aid, second clothing, etc., are provided.

The work done is doubtless very excellent and practical; but the people should understand thoroughly that it is they themselves who are leading, and that the churches are clinging desperately to their coat tails in fear of being left behind, while, as usual, trying to persuade the people that the churches are leading and not following.

Is Christianity the Supreme Religion?

CHRISTIANITY, considered as a system of Christ-like conduct, cannot die, says Professor Goldwin Smith.

Whatever may become of our creeds, and of the dogma (so plainly human in its origin) of some of them, we have still the Christian ideal of character, which has not yet been seriously challenged, does not depend upon miracle or dogma for its claim to acceptance, and may continue to unite Christendom.

This is quoted from a review, in *T. P.'s Weekly*, of two books on the religious situation. Goldwin Smith's is called, *No Refuge but in Truth*, which recalls the motto of the Theosophical Society, "There is no Religion Higher than Truth." The other book is *Is a World-Religion Possible?* by David Balsillie. The latter author says that the clergy recognize the religious tendency of the day, but are bound by their position to profess and preach what the people can no longer accept. But is not the attitude of these broader champions of Christianity similar to that of the clergy? Are not they also bound by a supposed necessity of championing Christianity among the world's religions, and the Christian Savior among the world's Saviors?

These men of great veneration feel deeply as they see the religion of their childhood and of their fathers slowly disintegrating; and they cling desperately to the hope that something unique may still be found in that particular religion. They fear that the absence

MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

of Christianity will leave a gap that cannot be filled. For them Christianity is indissolubly linked with morality and spiritual ideals.

But one of the most salient features in the recent expansion of men's thoughts has been the increased recognition of the claims of Oriental races; while one of the most striking changes of scene in the modern world-drama has been the increased prominence of those Eastern peoples. In face of this it is scarcely possible to identify Christianity with religion, or Christendom with civilization, or to keep on regarding Jesus as the only Christ.

But one may go farther, and question whether the Christian ideal of conduct is so very lofty after all; mightn't it be loftier? It contains ideals of mercy and charity; but is lacking in certain elements of manliness. These elements of manliness, in so far as they exist among Christian peoples, have been due to other influences than Christianity, notably to Chivalry; but Christianity often claims credit for them, even though it has been their adversary. It is not the ideals taught by Jesus that are here criticised, but that which the churches have made of them. In illustration may be quoted a passage from one of the writers in question. He says:

The duties He enjoined make no extravagant demand for self-sacrifice.

There might be two opinions about that; but at any rate it indicates that the writer's idea of religion is not over-exacting.

Again, the remark —

What is the Church but mankind viewed from the religious standpoint?

cannot be said to make out a case for Christianity in particular, rather than other religions; and the same applies to the remark that

we have come to believe that the conscience of the community as a whole is a safer guide than that of any section of the community; that the general is to be trusted before the clerical mind.

What about the community of the whole

world—the majority—Buddhist, Mohammedan, Hindû, etc?

The Truth is that which is common to all religions; and that which is peculiar to any one is not the Truth. If this be accepted, upon what are we to base any claim of paramountcy for Christianity, especially if its ethics be found as old as the earth?

How Long God took to Write the Bible

WE are told that the period during which the Old Testament was being written covers one thousand years, and that of the New Testament about one hundred years. Do people always bear this fact in mind when they speak of the Bible as the word of God specially written for his people? God took 1100 years to write it. The question arises: Did he ever finish writing it? The history of this wonderful compilation of ancient documents is very intricate and interesting. Moreover God wrote in several different languages — Hebrew, Aramaic, and Hellenistic Greek.

The Sin of Unbelief

A PASTOR is reported as having asked in a sermon, "What is the blackest, most heinous, [several other strong epithets] sin that it is possible for a man to commit in this world?" In answer he described some atrocious crimes, and said that these were nothing compared to the blackness of the blackest sin in the world. This awful sin [more strong epithets] is the [epithet] sin of unbelief; the rejection of Jesus Christ, God's only begotten and well-beloved Son. It is the one sin that is never forgiven in this world or the world to come.

One recognizes where this kind of violence of language belongs. Is it not that of the bigot, whose love for his gentle god is usually so manifested? that of the parties who added to the last chapter of Mark's gospel the verses 9 to the end, containing the words: "He that believeth not shall be damned"? (See marginal note in Revised Version)

He who persistently denies and rejects his own inner Divinity is lost. This is what Jesus states in the Gospels; but it was ecclesiastical bigots who transformed it into the threat that he who does not believe their dogmas will be damned by hell fire.

The unpardonable sin is that by which a man breaks away from his own divine immortal Self, thereby destroying himself by his own act and cutting himself off from the possibility

(CONCLUDED ON PAGE 11)

THE THEOSOPHICAL ADDRESS AT ISIS THEATER

At the Isis Theater last night Mr. Kenneth Morris gave the third and concluding lecture on "Theosophy in the Welsh Legends." To those who have heard these lectures, it may be confidently asserted, the Welsh legends as well as all other ancient legends and traditions will have a new meaning, related to life and to one's own struggles, conquests and possibilities in life, and not remain as mere stories as heretofore. Following are brief extracts from Mr. Morris' lecture:

No doubt it has seemed strange to many of you that a series of lectures on such a subject as Theosophy in the old legends of the Welsh people should be given in this theater; but on looking into the matter more carefully, one must, I think, see what a vital bearing such a subject has on our present life.

For first and foremost it will show that the ancient peoples—for what is true of the legends of Wales is also true of the legends of Scandinavia and Greece and Ireland, and indeed of most of the old countries from which we or our ancestors came—it will show that these ancient peoples had their Teachers who knew something real about the deeper side of life; something real about that greatest of all mysteries, man himself; that they had studied the divisions and intricacies of his nature and arrived at a clear understanding, a workable philosophy on which to base their lives. And if they had done this, so might we; for the old Wisdom is being taught in the world today as it was then. How can we hope to live successfully and master ourselves, unless we know what ourselves are that have to be mastered, and who are we that have to master them? See how story after story tells of the need we have for finding the divine light that is within us; and emphasizes the necessity of reaching to and getting the help of our own warrior souls before that divine light can be reached. That teaching is needed as much today as ever it was; more needed, you may say; for look at the awful blight of materialism that is over the world now. On all sides we find material wealth and what we call civilization increasing; and with them a greater carelessness about the purity and conduct of individual life; leading to the increase of crime and vice and insanity and all the dreadful conditions that go to sap the manhood and womanhood of the race. The only thing that can possibly stay this tide of ruin is that men should turn to their own lives and their own immediate surroundings, and do something there to better things. To cure a disease you must understand the disease and the human system that is suffering from it; and to help to cure the spiritual and moral disease of the age, you must understand the spiritual and moral make-up of a man. The ancient teaching is that a man can do what he will with his own life; that he can open up splendid centers within himself, and achieve marvelous heights of being. . . .

And there is a divine center in you which you may waken and bring into activity in your life, which alone can help you to gain it. There are huge battles to fight against the lower nature; but the soul in you, the strong will, whether you call it, as in these stories, Arthur, or Gwydion ab Don, or Manawyddan son of the Boundless, is more powerful than the lower nature. It is invincible, and can defeat all the passions and desires; for the soul is really a god, as Jesus himself taught.

Now is not this the most important lesson we can possibly learn? In view of the increase of vice, insanity, crime; in view of the growth of suicide, which means despair—is it not? We need a new and mightier source of courage; and it is this knowledge that there is the indomitable soul within us, with its ancient purpose to uplift the world, and that it rejoices in hardships and difficulties because they give it the opportunity for using and proving itself—it is in this alone that such a source of courage is to be found.—San Diego Union

The Churches

(CONCLUDED FROM PAGE 10)

of redemption. But it is only very exceptionally that a man can sin to that extent. He would have to persist in wickedness throughout incarnations; but usually rebirth brings with it a Karmic retribution that checks the evildoer in his career and gives the Soul its opportunity.

The churches may terrify people with threats as to what will happen to them after death if they do not accept the dogmas; but they cannot fool all the people all the time, and it is late in the day to address intelligent people in this fashion. It behooves us to have such confidence in the worth of our own character that the churches cannot thus impose dogma upon us, and to read the kindly teachings of Jesus without the harsh ecclesiastical glosses. Jesus promises knowledge and freedom to all who will seek the *kingdom of God which is within them* and will follow that *Truth that shall make them free*; and he says that those who follow the lusts of the flesh will suffer the fires of torment. By this expression he did not mean any eternal hell fire; he used a strong pagan metaphor to imply the tortures of the man bound in the chains of passion. A man who seeks happiness in the perpetual following of selfish desire is doomed to perpetual suffering and trouble; this is a simple truth; and this is all that is meant by hell, in which many of us spend much of our lives.

Those who preach doctrines of cruel revenge and fear in the name of a God of mercy are flouting their own divinity, and shutting up against men that kingdom of heaven into which they refuse to enter themselves.

STUDENT

The Relation of Zeolites to Plant-Nutrition

THERE is a tendency in many thinkers to be acute rather than comprehensive, and to base theories as to the constitution of nature on some special and limited range of investigations rather than on a survey of the whole field. It is not too much to say that a mind capacious enough to recollect at one and the same time *all*, or even most of, the data provided by scientific investigation in all its departments, could not possibly adopt any of those theories which have been designed to explain special cases, but would be obliged to frame some vast generalization adequate to explain the whole. But such minds are rare; and even when they exist, it is but rarely that their owners possess the qualities that bring men to the forefront of modern opinion. For the most part our prominent intellects in the scientific world are occupied with special subjects; and when they proceed to devise their theories, they frequently do so in forgetfulness of the discoveries made in other fields—discoveries which would doubtless, if remembered, entail radical alterations in their theories.

Despite the worthy attempts made to unify the various branches of knowledge and bring them all under one law, success in that direction is still far from complete. It is not easy for the physicist, engrossed with his study of molecular and intra-molecular forces in the materials of the physical and chemical laboratories, to preserve in his mind a vivid picture of the results of research in the animal, vegetable, and mineral kingdoms; and when he

does attempt an alliance with the biological side, it is apt to be one in which physics is the predominant partner. But perhaps the task of a general survey and co-ordination of results falls rather to the lot of minds not engaged in any special branch of investigation; minds whose innocence of hard work among the details may in reality be as great a recommendation for performing this task as, in the opinion of the specialists, it is a disqualification.

Attempts at unification between the physical and biological sides have so far tended to make the physical side the predominant partner, to regard organized nature as an extension of physical properties, and to express life and function in chemical and physical terms. Lately, however, the trend has been in an opposite direction. Recent discoveries in physics and chemistry have destroyed our reasons for regarding that department as simpler in its structure and functions than the organic kingdoms, by revealing an elaborateness and depth not previously suspected. We begin to wonder whether it would not be easier, after all, to explain chemical and physical action as a mode of life, rather than life as a mode of chemical and physical action. If we are to explain the complex by the simple, we can no longer explain biology by physics.

The particular branch of investigation proposed for present consideration is that of the mineral kingdom—as it exists in the rocks and rills. It is claimed by that ancient and comprehensive Science which Theosophy represents that even this mineral kingdom is endowed with life—that life being concomitant with intelligence and volition, and it has been predicted by Theosophists for many years that modern science would in this century find proofs of this claim. Not that scientists will discover the actual minds and wills that direct the workings of nature, for that is not its function; but that it will discover that omnipresent *life*, which reveals their existence. And there are already numerous facts in support; though not all new, for the annals of discovery are dotted with little episodes off the general track, as it were, and found scattered in odd places. These isolated facts, not lending themselves to the general theories, have been stranded; but they will often be found to connect up with later discoveries.

To proceed to our immediate topic—the influence of zeolites in maintaining the fertilization of the soil and the equilibrium of plant-nutrition.

Zeolites are a family of minerals that have resulted from the alteration, particularly the hydration, of other minerals, especially of feldspars. They occur in the cavities of the rocks from which they have been derived, as amygdulæ and veins and as minute microscopic specks. In these minute forms they commonly have a divergent fibrous structure. It is the action of heated water that causes their production; the rain, percolating to warmer depths, becomes heated, dissolves salts, and forthwith enters upon a career of chemical alteration and replacement, taking from one mineral, giving to another, and passing through endless cycles. These zeolites have even been found in Roman bricks, through the age-long percolation of alkaline water. A study of this kind of action, going on continually in the rocks and soil reveals the existence of a slow but active mineral life, as intelligent and busy

in its way as the life of the forest and jungle. The attempt to disregard this life is most disastrous to him who would form a true theory of nature; and to put it in a special class by itself, as being inorganic and not organic, or molecular and not vital, is a procedure unwarranted by the facts. The little that has been found out, a trifle compared with what ought to be found out, shows that the life is most varied and complex. A mineralogical Cuvier might find there kingdoms and sub-kingdoms of minerals, and a geological Darwin might organize them into an evolutionary scale and compile vast catalogs of facts to support his views.

Professor O. N. Witt, whose article in *Prometheus* is translated in the *Scientific American Supplement*, gives his theories as to how these zeolites operate in connexion with plants. Beginning by stating that plants absorb from the soil chiefly nitrates, phosphates, sulphates, and carbonates, of potassium, calcium, magnesium, and iron, which must be dissolved ere the root hairs can take them up, he asks how it is that these soluble salts are not washed by the rain into inaccessible depths. The answer he gives is that the zeolites act as storehouses and distributing agents of these salts. They are double silicates having alumina as a permanent base and one of the above-mentioned metals as a replaceable base. The replaceable base can be changed any number of times; it is not chemical affinity that determines the change, but "mass-action"—that is, any solution containing a certain base in excess will introduce that base into the zeolite in exchange for the zeolite's base. Hence this mineral is capable of taking from the soil any salt of which there is too much, and giving to it any salt which it lacks. It exercises a similar economy upon the plant. The roots not only absorb but excrete; the zeolites take up the rejected matter and give food in return.

In the winter, when the plants rest, the zeolites have a chance to renew their supplies from the decomposing minerals about them; thus being ready for the plants again in the spring. But if exhaustion should occur prematurely, the plant can take up temporarily salts of a kind that it cannot directly use in the building of its structure, keeping these until it has a chance of exchanging them with the zeolite for the kind it does use. This is not given as a theory but as an explanation; for the writer tells us that it had been observed that plants do take up salts that they do not need, and that now we see why.

Thus the soil and the plant work together in a "symbiosis," and a balance and economy of life is maintained; a fact of supreme importance and interest to the man of science both theoretical and applied. And while the chemist and the farmer may not perhaps interest themselves much in the question of ulterior causes, the reflective mind will find ample food for thought. He will ask himself how such marvelous and exhaustless resourcefulness and activity can possibly be attributed to the action of blind forces and senseless matter, and may perhaps be helped to arrive at the only possible conclusion—that all nature is peopled with living beings endowed with intelligence and purpose; that her works, like the works of man, are the outcome of design in the minds of conscious architects; and that at bottom the universe is one vast

unfathomable ocean of consciousness comprising infinite hierarchies and orders of existence, of which those of the animal and vegetable kingdoms constitute a fraction only.

Turning on One's Heel at the North Pole

IT is known to the proverbial schoolboy that a traveler around the earth gains or loses a day according to which way he goes. If on the equator, he would have to travel nearly 25,000 miles to accomplish this; if in a higher latitude, he need not go so far. As he approached the pole, the circles around the earth would get smaller, until, when he finally stood on the pole, he would only need to turn around on his heel. Now suppose a man standing on the pole and turning round and round; with every turn, he gains (or loses) a day. Supposing him to turn at the rate of once a second, he would gain or lose 60 days a minute, or 3600 days an hour. Allowing him an 8-hour working day, he would thus gain or lose 28,800 days in a day's work—that is about 79 years. In a week (Sundays off) he would make about 470 years.

Thus it is easy to see that he could travel into the past or the future, and there is no doubt but the discovery of the north pole will enable us to unravel many of the problems of history and to make many useful predictions. Say, for instance, we want to find out whether Jesus Christ really lived; all we have to do is to go to the north pole, turn around the requisite number of times—it could be done by machinery while we slept—until we got back to the year 33 A. D., then walk down the right meridian for Bethlehem or Galilee.

Neither Cook nor Peary seems to have remembered to note how many times they turned around when at the pole. Consequently there is likely to be some confusion of dates, and we may never know which of them really discovered it first. And perhaps some one else may have discovered it years ago and gone off into the future, by turning around many times before he came back, thus arriving here in 1910 perhaps, so that we do not yet know of him. On the other hand, if he had rotated in the other direction, he would have arrived here before he left the pole, perhaps even before he started for it; and so, though the pages of history might record his story, no one would have believed it.

CENTURY PATH'S MATHEMATICAL EXPERT

Transmission of Variation

A BIOLOGIST, whose paper is translated from *Die Umschau* for the *Scientific American Supplement*, claims to have proved by his experiments that mutations can be produced in bacteria, which mutations are thereafter transmitted to succeeding generations, even though the conditions that caused the mutations are withdrawn. For instance, he took a bacterium, which, on cultures free from milk sugar, forms flat smooth colonies, and placed it on a culture containing milk sugar; whereupon it began to produce knob-like elevations. These knobs were composed of bacteria which had acquired the power to produce lactic acid fermentation in milk sugar. This characteristic is transmitted to all the descendants, which retain it during years of culture on media free from milk sugar. Other bacterial researches yielded similar results.

Of course the Darwinian theory depends on the question as to whether or not mutations can be hereditarily transmitted. For if they cannot be transmitted, how could one species ever give rise to another? And this question is still one of the most hotly debated points. Some say that mutations are not transmitted, but that only the typical and permanent features of the species are transmitted. In this case, of course, the effect of inheritance would be to preserve specific types, not to transmute them. Others think that mutations are transmitted; in fact, those who believe in the Darwinian doctrine of descent must necessarily admit that mutations are transmitted.

Howbeit, it is evident to all that the variation must be exceedingly slow, for we find that types persist almost unchanged for very long periods. To evade this difficulty some have proposed the theory that variation takes place by comparatively sudden but periodic stages—the mutation-theory of DeVries. Observation of the facts ought to settle this question.

It is taught in Theosophy that most of the former variations that took place in the animal kingdom was accomplished in the astral period preceding the emergence of the astral prototypes into the physical plane, and that this is why science is unable (as yet) to discover the common ancestors from which different types—say those of the horse and the ox—sprang. Many of the missing links sought cannot be found by ordinary scientific methods, because they existed only on the astral plane. The marked types having thus been molded astrally, then, after ages, appeared on the physical plane where they were differentiated into the various families, genera, and species.

With bacteria it seems easy to understand that the process of variation, like other processes in that class of creatures, may go on with much greater rapidity than in the higher forms. The question of the variation of the higher forms must be settled by appeal to the actual facts, however, not by inference from bacteriological phenomena.

According to Theosophy, then, while variations may be produced on the physical plane, these are not sufficient to account for the whole process of evolution. To them we have to add the variations produced on the subtler planes, as mentioned above. And in the case of Man in particular, there are still other and far more important factors entering into his evolution. Neither the physical nor the astral evolution suffices to produce everything that enters into the constitution of Man; there has to be spiritual evolution as well. STUDENT

Chemical Symbols and Ancient Symbols

(CONCLUDED FROM PAGE 3)

The final words quoted from the professor—"Perhaps no two other symbols have so great a significance: they reach into life itself"—sound curiously after the badinage (if it be badinage) about the Freemasons, etc. Why do the Masons wear symbols, anyhow?

There is no getting away from the fact that research is bound to rediscover ancient secrets and to reconstitute ancient knowledge. The ancient pre-Christian science, preserved in its symbols, was based on truth; and the more researchers are faithful to the truth, the more they will verify that ancient science. It had greater generalizations of natural law than we have as yet ventured upon; yet we are beginning to guess in that direction. T.

Art Music Literature and the Drama

The Irish Cross---II

IT is appropriate that the cross and circle, the most widespread symbol of the Divine Life Manifest, should be associated in the minds of so many persons with the ancient Isle of Destiny, Erin, the Sacred Ierna, as the classical writers called it; for that land was formerly one of the important seats of the Mysteries.

In a learned study of the meaning and world-wide diffusion of the cross before Christianity, H. P. Blavatsky, in *The Secret Doctrine*, shows that the cross-and-circle has been used from time immemorial as a most expressive symbol of Creative Cause, the vertical and horizontal lines typifying the duality or opposite polarities which necessarily appear when the first flutter of manifestation starts out from the Unknown "whose face no man hath seen," the Infinite Circle of Divinity. The four arms of the cross also stand for the four Elements—the spiritual Intelligences which manifest on the earth through the four elementary states of matter, airy, earthy, fiery, and watery.

A cube (a symbol of man) unfolds in the form of a cross, and though there are but six squares, the four descending and the three cross squares give the number seven, the number of the human principles. According to one method of regarding it the cross represents the passions on which the Higher Ego is crucified daily, but H. P. Blavatsky says that while the primary signification of the cross was "the second God who impressed himself on the universe in the form of a cross," "the decussated cross in space" of Plato, or the divine Creative Manifestation of the unknown hidden Cause, the symbol was adopted in the Mysteries as the representation of mortal man becoming reborn as an Immortal by crucifying the passions and desires on the Procrustean bed of trial and self-discipline—of purification.

It is at last becoming generally known that the symbolism of the cross has a much wider and profounder meaning than simply that which the faith of Christendom attaches to it, and that meaning reaches to the supreme culmination of our being. In Egypt and elsewhere the solemn ceremonies at the initiation of a truly prepared candidate for Light included the placing of him upon a cross and his

rising therefrom after three days and nights of inner trials and mystic experiences. This new birth, the spiritual regeneration by the conquest of passion, was the final and glorious culmination of many lives of struggle against the lower nature. He who fully comprehends the meaning of the cross and the circle is forever liberated from the toils of the great Il-

have never seized the true Spirit of the teaching of Christ, and by their interpretations they have degraded it in more than one way. They have forgotten the Spirit of that universal symbol and have selfishly monopolized it—as though the Boundless and the Infinite can ever be limited and conditioned to one manifestation individualized in one man, or even in a nation.—*The Secret Doctrine*, Vol. II, p. 556

The beautiful and revered Irish crosses, then, whose shape was directly inherited from the mystic symbol of the ancient Mysteries, form an interesting link with the far-off past of Ireland's spiritual greatness. The cycle has been running down until now, but a change is coming, and as the people have never fallen entirely into materialism, but have kept the warm-heartedness, the poetry, and the simple devotional spirit, however misdirected it may have been, they will respond quickly to the new spirit of Brotherhood which is making itself felt throughout the world. CASHEL

LOHENGRIN

From symbolic painting by R. Machell
formerly of London, Eng., now of Point Loma, California

lusion. H. P. Blavatsky says, in speaking of the wider application of the cross symbol:

The Spirit of Life and Immortality was everywhere symbolized by a circle: hence the serpent biting its tail represents the circle of Wisdom in Infinity; as does the astronomical cross—the cross within a circle. . . . Alone among the Apostles of the Western religion, Paul seems to have fathomed—if not actually revealed—the archaic mystery of the Cross. As for the rest of those who by unifying and individualizing the Universal Presence . . . they

tures if they were less ugly, less coarsely painted, less weirdly unlike nature, less dismal, and—smaller. All these requirements could be satisfied without a sacrifice of artistic conscience by the painter.

Everything has to be useful nowadays; and indeed do not art and utility approach each other in proportion as each elevates itself? And should not technique be balanced by human sympathy and understanding? SUBURBUS

Painters and the Public Taste

A WELL-KNOWN English painter, the Hon. John Collier, writing in *The Nineteenth Century and After*, takes the view that painters may save their profession, without sacrificing their artistic conscience, by studying the tastes of the public. This will perhaps be a surprise to some, who may have been brought up on the idea that the public is a hopeless "Philistine." Yet this artist says that the public taste is not a whit more depraved than the taste of the average modern artist—these are his own words—and he is sure it is much less depraved than that of the average modern critic.

The public likes beauty, especially human beauty; a certain measure of finish—its rooms are too small to exhibit broad effects; detail; a certain simple realism; and a cheerful rather than a depressing subject. It would buy pic-

To ask "Will Theosophy change present conditions?" is but to elicit the assurance that it has already changed them—*Katherine Tingley*

AT the annual meeting of the American Academy of Medicine, in Atlantic City, the address of the President, Dr. Helen C. Putnam of Providence, R. I., was upon the subject of "American Characteristics and Professional Responsibility." She is reported as saying:

The census and other statistical reports show that we have grown from an infant among nations to a leader or rival, in value of exports, suicides and insanity, inventions, murders without convictions, multimillionaires, fatalities and other accidents of transportation and industries, national wealth, infant mortality, developed natural resources, wastefulness of timber, waters, mines, and animal life, vastness of business combinations, increase of vice, social diseases, divorce, school population and educational institutions, vagaries in religion, psychology, economics, and medicine, manufactures, wage-earning children, tramps, unemployed and unemployable, numbers and excellence of sociologic movements for social betterment. Our mistakes are chiefly due to ignorance of and indifference to life, including as a result greed and indifference to law. The medical profession is logically responsible for removing this fundamental obstacle to worthier ambitions—ignorance of biological facts, phenomena, and laws—ignorance more profound since we are so rapidly becoming a nation of city dwellers. What a few public school instructors are beginning to do wisely the profession should give its utmost support to forwarding.

For America to take the lead in such an assortment of conditions is evidence that with all our strenuous living we are guilty of both ignorance and indifference regarding fundamental laws of life and its higher purpose. However, it will require something more illuminating than the student light in the biological laboratory to show the way out of this tangle of good and evil.

The real essence of life is of so fine a quality as to elude the most delicate chemical test, the most powerful microscope, and the keenest scalpel; and the religious experts seem to be equally unable to locate it satisfactorily. Neither the doctors, the ministers, nor the educators, with their present limited

THE LOGIC OF ETHICS

conception of man's complex nature, are prepared to turn this whirlpool of human forces into beneficent and worthy channels. These American characteristics, which compose a material, an intellectual, and a psychological paradox, are but striking examples of similar conditions found everywhere, and the solution of our problem will answer the world's query. Infant nation that we are, our cosmopolitan

SAPPHICS

SOON the maples, soon will the glowing birches,
Stripped of all that summer and love had dowered
them,
Dream, sad-limbed, beholding their pomp and treasure
Ruthlessly scattered:

Yet they quail not: Winter with wind and iron
Comes and finds them silent and uncomplaining,
Finds them tameless, beautiful still and gracious,
Gravely enduring.

Me, too, changes, bitter and full of evil,
Dream by dream have plundered and left me naked,
Gray with sorrow. Even the days before me
Fade into twilight,

Mute and barren. Yet will I keep my spirit
Clear and valiant, brother to these my noble
Elms and maples, utterly grave and fearless,
Grandly ungrieving.

population and our opportunities lay upon us a peculiar claim of duty to every parent country.

Only Theosophy is comprehensive enough to give a meaning to life in its fulness and to show the logic and ultimate necessity of worthy and unselfish ambitions. The teachings of immortality and human perfectibility are but natural facts viewed in harmony with the laws of Karma, of Reincarnation, and of

Brotherhood. We should not be so wasteful of natural resources, so regardless of others, of social ties,

of life even, if we understood that the equalizing Karmic law would hold us accountable for every talent and opportunity, and that the law of Reincarnation would provide the necessary number of lives in which to work out the adjustments. We should be less greedy if we knew that the law of Brotherhood makes our ignorance of or indifference to the condition of others no protection against their sufferings reacting upon us and that the basic ties of humanity render mental and moral conditions quite as contagious as physical.

The theology which has long coaxed and threatened us with a hereafter quite unrelated to the familiar present has lost its moral holding force upon a sceptical literal age which challenges every investment—even in faith—with "What is there in it for me?" The biological view of the physical fact of birth into a world of change, from which to disappear mysteriously at death, does not give the clue to the immortal man whose real purpose here is to attain to a realizing sense of his natural perfectibility.

The logic of morality is lacking without Karma and Reincarnation. If we are to live but once, why not crowd all the living we can get into the time? And life, whether to the scientific materialist, the sensualist, or the average individual, is largely a matter of mental and material possessions and sensations. With all our getting we have gotten but little understanding of our own make-up and in our greed to acquire externals we have failed to find our resources of inherent greatness. Whereas we used to be willing at least to begin reform in the next generation, we have grown more lax in the moral training of the children. Where their physical well-being is threatened by parental habits, we draw upon the hope that they will escape through the loopholes in the uncertain action of heredity, or that science will

conjure up a serum wherewith to offset the results of broken law.

The claims of posterity are ignored when one is entangled in a mesh of vivid experiences; but to know that the unfailing Karmic law makes us our own heirs, physically, mentally, and morally, is bringing responsibility home even to the selfish. LYDIA ROSS, M. D.

The Right Protest

MANY students of human nature and the conditions of human life will remember occasions when, some evidence of gross immorality having been pressed upon their notice, women have been roused to make indignant protest against existing evils and to express denunciation of those whose vicious lives are a menace to all in the community and especially to the youth. They will remember the attitude, resembling a terrified clutch, of these women toward the young folk whose moral surroundings were thus vitiated, and also their own feelings of relief — this when they were themselves young and inexperienced — at being assured that a normal scheme of society does not include any of these horrors.

Looking back at such situations the Student recollects that there was an absence of anything very real and positive in the way of safeguarding the young, and, to tell the truth, something negative and weak-kneed about the indignation and the protests expressed. And how little has been accomplished in the way of protecting the young from evil influences! How much more frequent now than some years ago is the recurrence of the haunting fear that children cannot be kept safe from blighting forces. Ought not the right kind of protest to have been able to invoke beneficent power strong enough to check the evil?

Has the protest been of the right kind? We know that indignant people often make strong statements about the evils that threaten the social system without having in their own minds any positive ideal of better conditions — immunity from painful experience is what they crave — and without having any intention of disciplining themselves according to the highest moral code they know of, with the end in view of leavening the world afresh. Is it not a gruesome fact, that even while condemning evil conditions, many people have in their hearts a very shivery belief in the possibility of frail human nature ever being toned up to the practice of the stern morality it is so easy to decry the absence of! They will say that it *should* be true that the brute nature shall lose its ascendancy, but they do not all — and women conspicuously fail in this respect — feel in their own hearts the certainty that it will be so, nor do they assert with the positiveness born of knowledge of their Divinity that it *shall* be so.

The positiveness born of knowledge —

there's the point. Women must learn a true philosophy of life, they must know the constitution of human nature and the purpose of life. Then with a basis of knowledge and a glorious trust in the higher nature they can speak their protests against evil with the illumined conviction that is a challenge to every latent power for good in every listener, accomplishing a kind of rally of beneficent influences and a firing of energies of which the Great Law may avail itself in unfolding some of the higher aspects of human life. This would put an end to the condemnatory shilly-shallying that so often ends in nothing but a review of revolting details. If all the women in the world made the right protest, based on conviction that human nature has the power

whole design was carved out of the solid mahogany itself. Chests, often enormous, now of Celtic and Icelandic design, again of Greek or Renaissance, are thought nothing of by a number of women workers, and many an artist is familiar with the wonderful and massive carvings in the beautiful home of Benn Pitman (for some years teacher of carving and design in the Cincinnati Art Academy) all of them done by his daughter and by his wife, the latter a sister of the gifted American painter, Elizabeth Nourse. To see these apparently frail women working upon some enormous and massive piece of high-relief carving was a lesson in woman's resourcefulness and ability. For carving is laborious work at best, and often tests not only the skill but

Lomaland Photo. and Engraving Dept.

FLORENTINE HAT-WEAVERS

to live purely, and on a shining trust in the divine part of that nature, the world would begin to change in a day. STUDENT

Jottings and Doings

(From a Student's Note Book)

WOMEN have for years excelled in wood-carving, but in the public mind their work is usually associated with fragility, smallness, and sometimes, alas! feebleness of design. Why this has been so it would be difficult to state for the amateur and dilettante have done no more to cast discredit upon professional and strong workers in this than in other art lines. As a matter of fact, some of the most massive and remarkable wood carvings in America are by women, among them a copy of the famous old staircase in the Cluny Museum (France), which was done entirely by a woman and stands now in her Vermont home. In many respects it is more remarkable than the original, for while in this the ornament in some cases is applied, in the copy the

the strength of the strongest man. Yet, in view of its fascination as an art-craft, it is surprising that more women do not take it up, and the strenuous physical demand it makes must act reflexly to strengthen the character.

MRS. CARMICHAEL STOPES, lecturer on fossil botany in the University of Manchester (England), is stated to possess a more exhaustive knowledge of the subject than any other living person. Recently she made a long tour through little known regions of Japan, in order to pursue geological researches, and succeeded in securing hundreds of unique and valuable specimens. Part of her journeyings took Mrs. Stopes among the so-called "savage" Ainos on the northern island, yet although she traveled entirely alone, nowhere did she meet with rudeness or discourtesy from the natives. Mrs. Stopes went to Japan chiefly to study the "coal balls" found there, which have been so great a problem both to the botanist and geologist. Her researches will shortly be published.

WORK DONE BY THE ART CLASSES AT THE RAJA YOGA ACADEMY
PINAR DEL RIO, CUBA

The Tenth of October in Cuba

NATIONS have memories. As the United States never forgets the Fourth of July, so does Cuba hold the Tenth of October in the center of its heart. At dawn on that memorable day, the voice of Cespedes was heard calling to action the small group of patriots who had gathered at his home:

"Arise! the soldier on duty never permits the sun to surprise him in bed."

Born in Cuba of an old family of Spanish ancestry, Cespedes passed his boyhood in surroundings of ease; and his love of nature was freely cultivated amid the beauties of mountain and river. Of a generous and kind disposition, he made many friends. He became a clever writer and a brilliant lawyer; and his wealth and ability and great personal charm gave him a commanding social position as a young man. He traveled much, and lived for a time in Spain and while there became deeply interested in the political condition of both Spain and Cuba. At heart a true patriot, from childhood he had imbibed the spirit of freedom that was silently at work; and when it became visible in the efforts of Cubans to arouse the country to action, Cespedes was always in sympathy and did all in his power to encourage right action.

Four times Cespedes was imprisoned for his courage in daring to protest against injustice; but undaunted by obstacles he persevered, and

in the critical year of 1868, when, on the Tenth of October, a Declaration of Independence was made, Cespedes led the heroic little group of patriots to their first victories.

Cuba had no flag. Narciso Lopez in 1850 had designed the one now in use; but his expedition at that time ended disastrously, and the flag so displayed by those early patriots was lost. At the Cespedes uprising, couriers were hurriedly dispatched to procure cloth of red, white, and blue to fashion a flag as like that of 1850 as they could remember to do it. The red and white colors were speedily brought, but the courier for the blue was delayed. Not a moment could be lost. What was to be done? With sudden inspiration Cespedes turned to the picture of his wife, and taking from it a covering of blue cloth, said that if she were living she would offer every assistance to the expedition, and they might take this as her blessing and a good omen. From the flag thus fashioned were their first victories proclaimed, and today the "Flag of Cespedes" is held among the treasures of the Republic.

The first act of Cespedes was to free all his own slaves, and as soon as the Republic was founded and he was elected President, he issued a proclamation for the freeing of all slaves in Cuba.

When the young Republic was but five years old, so troubled were the times, so little

did the people in the mass understand the principles of self-government, that Cespedes — the statesman, the warrior, the lover of humanity — was forced to withdraw from the Presidency to avert civil war.

A man of pure thought and right action, Cespedes would do nothing for his own fame or glory, though this path was opened to him many times by circumstances. On the contrary, he permitted his vast estates to be confiscated and himself to be exiled from a princely home. With a reward offered for his capture sufficient to have been the ransom of a king in the olden time, Cespedes fearlessly and ceaselessly worked on for the cause of Cuban freedom, ever loyal and true, in adversity as in prosperity.

Realizing that he could best serve Cuba for a time by working outside of the Island, Cespedes, while awaiting his passport, retired to the mountains. He frequently visited a neighboring ranch where there were some little children to whom he taught the letters of the alphabet. One day when engaged in this favorite pastime, with one of the little boys upon his knee, the enemy, who had learned of his whereabouts from a prisoner, surrounded the place, and the doom of the great patriot was sealed. On the Tenth of October comes always the sacred memory of Cespedes, whose noble example has shown the Cubans the path of honor in the fulfilment of duty. E. W.

THE CHILDREN'S HOUR

The Blackbird and Elsie

"WHY here comes Mr. Blackbird!" said Elsie, as he flew lightly down at her feet where she sat in the shade of the big palm one bright morning. "You have not been here for a long time."

"No, I've been busy," said the bird. "Mrs. Blackbird and I have had our hands full, or rather our bills full, feeding those children of ours, but now they are able to fly and take care of themselves. A fine nest full this year, Miss Elsie, all bright little fellows; but how are you getting on nowadays? Have you found out who you are yet?"

"No, Mr. Blackbird, I cannot say I have, but I am finding out what I am good for."

"It is a great step ahead when you begin to find out that," the bird replied, "but suppose we try to find out what you are not; it might lead to a discovery. Are your hat and dress *you*?"

"No, of course not," said Elsie, laughing.

"Is your hair *you*, or your nose *you*?" he asked again.

"No," Elsie replied, "they belong to my body."

"Well, is your body *you*?" again the bird asked.

"No," said Elsie.

"Well, what is then?" asked the bird. "What is it that loves Mother?" the blackbird asked.

"Oh! that is I," said she, with a flash in her eye.

"What is it that knows, and feels sorry when you have done wrong, and happy when you have done right; that wants to do things to make other people happy?" said the bird, "and loves the bright sunshine and flowers—"

"And blackbirds!" cried the little girl. "It is really I! Oh I see, it's something that knows things, that wants to be loving and good and to help, which is really I. But, Mr. Blackbird, what is it that wants to be naughty?" said Elsie, looking very serious.

"Oh, that's your servant," said the bird, "whom you must train not to be naughty."

"Oh, now I understand better," said Elsie to herself, and she gazed far off to the distant mountains, and while she was thinking the blackbird flew away.

How Seeds are Cradled

ON the hillsides and in the gardens the plants are now very busy. Many of them have already their seeds and are just waiting an opportunity to get them all scattered around.

As the plants can not run around and do this themselves, they have found out many wonderful ways of getting it done. Some of the forest trees—birch, elm, and ash, for instance—provide their fruits with wings and ask the wind to carry them on his strong back to some place where they can find a nice, soft bed for their winter sleep. The willow dresses every seed in the finest little feathers, so that it can fly swiftly around for the softest breeze. The poppies open their capsules only a little

Lomaland Photo. and Engraving Dept.

THE EIFFEL TOWER, AND BUILDINGS ERECTED FOR THE EXHIBITION OF 1900

THE MYSTERY OF THE SEED

CHILDREN dear, can you read

The mystery of the seed,
The little seed, that will not remain
In earth, but rises in fruit and grain?

A mystery, passing strange,
Is the seed, in its wondrous change;
Forest and flower in its husk concealed,
And the golden wealth of the harvest-field.

Ever, around and above,
Works the Invisible Love:
It lives in the heavens and under the land;
In blossom and sheaf and the reaper's hand.

—Sower, you surely know
That the harvest never will grow,
Except for the Angels of Sun and Rain,
Who water and ripen the springing grain!

Awake for us, heart and eye,
Are watchers behind the sky:
There are unseen reapers in every band,
Who lend their strength to the weary hand.

When the wonderful light breaks through
From above, on the work we do,
We can see how near us our helpers are,
Who carry the sickle and wear the star.

—Sower, you surely know
That good seed never will grow,
Except for the Angels of Joy and Pain,
Who scatter the sunbeams and pour the rain!

—Child, with the sower sing!
Love is in everything!
The secret is deeper than we can read:
But we gather the grain if we sow the seed.

Lucy Larcom (Selected)

on the side. It takes a good hard shaking to make the seeds roll out. Thus only a high wind, which carries them far away from the mother-plant, can disperse them. In other plants the valves of the fruit open elastically and shoot out the seeds in all directions.

Some plants have still another way of sowing their seeds. They make the fruit soft, juicy, bright colored, with delicious taste, and hide the small, hard seeds inside. These fruits, such as apples, oranges, peaches, apricots, etc., are eaten by birds, beasts, and human beings, who all throw away the hard kernels and thus help to scatter them around. The white berries of the mistletoe are eaten by the missel-thrush. They are very sticky and fasten to his beak and feet. In order to get rid of them he scrapes his feet on the branches of some tree, and if it happens to be a poplar or apple tree, the mistletoe has found just the place where it likes to grow. Other fruits are provided with prickles; you all know about them. They fasten to the coats of sheep and cattle who find them very disagreeable and rub them off as soon as they can. Sometimes they cling to the stockings and dresses of little children and I am sure you all pick them off when you come home, and thus help to carry the little seeds about.

So, as you see, nearly all little seeds are cradled far away from their mothers. In the earth they find a nice, soft bed and there they sleep until they are awakened by the gentle touch of the warm sunbeams in the spring. What happens to them then I will tell you another time.

BIRGIT

The Eiffel Tower

THE accompanying picture is a view of the Eiffel Tower of Paris from across the river Seine, together with several buildings of the Paris Exhibition of the year 1900. Many of the buildings occupied considerable space on either side of the river so that the ferry boats and other craft formed a part of the scene and added much to the beauty of the picture, as they moved swiftly to and fro from one landing to another.

These great exhibitions are given in Paris every ten years and are a great attraction to visitors from all over the world.

The expense of keeping the Eiffel Tower in repair has been so great of late years that there has been some idea of tearing it down, but it has finally been decided to use it for a wireless telegraph station.

E. P.

A Dog Bell-Ringer

DON Carlos is the name of a very intelligent collie whose master is a lighthouse keeper on the shore of Alaska. Don Carlos has learned to watch for the coming of the fog; when it rolls in he needs no telling but runs quickly to the fog bell and pulls the rope to make the bell ring. He can be trusted to attend to this while his master is busy with the lamp. He is a faithful servant, his master says, and a kind friend and guardian in this lonely place in the far north.

The Evolution of Man

THEOSOPHY teaches Evolution, as is well known to students; but its teachings in this respect are far vaster and more comprehensive than the theories put forward by many scientific authorities under the same name. While modern science has recognized the principle of Evolution, it has allowed its speculations to be much limited and warped by certain prejudices and preconceptions. Theosophists would not destroy the theory of Evolution, but would fain rescue it from these distortions.

One of these scientific preconceptions is that the human race has pursued a *single ascending line* of evolution, from the most primitive types through gradually advancing stages, up to the present level which represents the highest yet attained. This theory is not founded upon observation of the facts, as a scientific theory should be. It is an inference from the general theory of evolution which grew up with Darwin, Spencer, etc. Nevertheless those who hold this theory seek support for it in the facts. It is the claim of Theosophists, however, that the facts will be found to confirm the larger Theosophical teachings as to the evolution of humanity.

Of course it is necessary for the upholders of the theory to show that the farther we go back in time, the more primitive are the human remains we find. On this point Lyell, the father of geology, said:

The expectation of always meeting with a lower type of human skull, the older the formation in which it occurs, is based on the theory of progressive development, and it may prove to be sound; nevertheless we must remember that as yet we have no distinct geological evidence that the appearance of what are called the inferior races of mankind has always preceded in chronological order that of the higher races. (*Antiquity of Man*, quoted in *The Secret Doctrine*, Vol. II, p. 721)

Have subsequent discoveries warranted a different opinion? Few would be bold enough to say so. Such scanty discoveries of prehistoric human remains as have been made serve but to show that in those ages there were barbarians on earth; but nowhere have we found traces of a race more primitive than some which exist on earth at the present day. There is nothing, therefore, in this evidence to prove that the earth then was any different, in respect of humanity, from what it is now; if, side by side with the savages, there were civilizations, the remains of those civilizations would have perished under the scythe of time.

But speaking of ancient civilizations, let us ask what has been the trend of archaeology in

this matter since Lyell wrote. Has it not been to extend ever farther and farther back the limits of civilization? Despite the extremely grudging attitude which dogmatism, both religious and scientific, have assumed toward the question of the antiquity of civilization, we have been forced to concede it an ever greater age. And Theosophists claim that the facts, if studied without prejudice, amply prove a far greater antiquity for civilization than people will admit.

Voltaire, the greatest of sceptics, but with the acutest of minds, thought it quite likely that

Cycles of Rising and Falling Civilization

Long before the empires of China and India, there had been nations cultured, learned, and powerful, which a deluge of barbarians overpowered and thus plunged into their primitive state of ignorance and savagery, or what they call the state of pure nature. (*Lettres sur l'Atlantide*, p. 15)

And Bailly, the great French astronomer, believed in Atlantis and speaks in a letter to Voltaire of the Brāhmans of India, of whom he says:

But your Brāhmans are very young in comparison with their ancient instructors.

Professor Soddy has recently given expression to similar views regarding the probability that there were ancient civilizations, possessing profound knowledge of natural science, which were destroyed by cataclysms. The existence in so many regions of gigantic masonry confirms the belief; and archaeologists who delve into the history of ancient empires can find nowhere the beginnings of their culture, which in every case seems to have been derived from a still older source.

The Theory of Apo-descent a Mental Pendant

It is indeed a remarkable instance of the inequality of current opinion that there should still be found so many influential names associated with the attempt to establish the narrow theory mentioned above. The following quotation will give some idea of their efforts:

An enormously long period must have elapsed between Neanderthal man . . . and *Homo heidelbergensis*. . . . No fundamental objection stands against the view of Rutot, Klaatsch, Verworn, and others that the first beginnings of human cultural development reach far back beyond Diluvium into the middle division of the Tertiary period (Oligocene according to Rutot). . . .

Neanderthal man, then, is of slight antiquity compared with *H. heidelbergensis*. Klaatsch has for years upheld the theory that to discover the roots of the human race we must go very far back, perhaps even to the roots of the mammalian genealogical tree. . . . To explain the similarity of human and anthropoid forms we must go back to the remote ancestor from which there branched off on the one side the genus *Homo* and on the other the genera of

anthropoids and perhaps of other ape-species. (From a review in *Nature* of an article in *Globus*)

At the conclusion of the paper, says the reviewer, is a discussion of the genealogical tree of the phylogeny of man and the anthropoids, recently published by another man of science, and in which *Pithecanthropus erectus*, *Homo heidelbergensis*, and Neanderthal man may be regarded either as successive stages in the direct line of descent of *Hominidae* or as offshoots from those stages.

Even if we granted that there has been an evolution of the kind imagined, and even if we extended it back to the animal kingdom, still no case whatever would have been made out for a materialistic or animalistic view of life or for a denial of spiritual powers. For, in order that such an evolution may be possible, we must either suppose it due to the interference of extraneous powers or to inherent capacities in the low forms. Human intelligence and conscience must have come from somewhere; in the animal must have resided all the spiritual potentialities of the Shakespeare and the Goethe. What, then, can be the object of materialism in striving to make out its fancied history of the human race? The present-day "seeming process of development, working from the less to the more perfect, and from the simpler to the more complex" has been exalted by scientists into a universal law, armed with which they rush to Nature and seek to make her facts fit into their too hasty conclusion. But it is only "a very imperfect generalization of a mere secondary nature in the great Cosmic process" (H. P. Blavatsky). If we look at Nature we shall find that there are processes from higher to lower, as well as from lower to higher. The gigantic fauna and flora of Mesozoic times, now represented by dwarf forms, are instanced. A man of science, writing in the *English Mechanic*, says:

**Imperfect
Generaliza-
tion of mere
Processes**

The earliest remains of reptiles appear to have been found in the Coal-Measures of the Carboniferous period. . . . Reptiles appear to have gradually increased in size, until the Triassic, Jurassic, and Cretaceous epochs, when they seem to have reached their maximum dimensions. . . . At the time of the early Cretaceous period the largest reptiles appear to have gradually decreased in numbers, and by the close of it these great creatures had vanished altogether, leaving apparently no living descendants.

The *Tuatara* or *Hatteria* . . . of New Zealand . . . is the only living reptile that is closely related to the ancient ones. . . . The majority of the reptiles of the present day are probably descended from a race of animals much smaller in size than that of the ancient Dinosaurs. . . .

During the voyage of H. M. S. *Beagle*, Charles Darwin studied the habits of some large marine lizards, named *Amblyrhynchus cristatus* . . . which are found on the rocky shores of the Galapagos Islands . . . and which live almost entirely in the sea. . . . These marine saurians grow from 3 to 4 feet in length, and are black, with a serrated ridge on the back; they have long compressed tails, partially webbed feet, and swim with a serpentine movement of the body and tail, the legs being pressed against the sides; they are quite harmless and appear to be the only marine lizards now known to exist.

And has it not been so with the races of men? What are the present "aborigines" of America, Africa, and the Pacific islands, if

not the remote descendants of ancient civilizations?

But it must not be thought that Theosophy denies evolution or progress. On the contrary, it recognizes perpetual progress. But modern-day thinkers desire to make the drama too small,

and cut-and-dried. Science observes only what takes place in the outermost world; but the greater drama is carried on in the invisible realms of mind and soul. There is such a thing as the evolution of a human Soul; and the successive experiences which it is necessary for that Soul to go through on earth do not require that there should be such a cut-and-dried progression of types as that imagined by science. Reviewing the history of the animal kingdom, as revealed by palaeontology, we find that in the far past there have existed gigantic forms that have disappeared; their evolution seems to have gone the wrong way. But what do we know of the intelligent souls which tenanted those bodies?

In the past history of humanity there have been times when it has attained the zenith of culture and knowledge, and times when all this has been swept away and barbarism has reigned. These successive stages are all scenes in the great drama of the evolution of the inner Man. The details cannot be set forth

simply; the whole subject is much too vast; if it were not so, would it be worthy of study? Would it be adequate to the dignity of Man?

In fine, what Theosophy asks is a broader outlook, a more intelligent study of the facts, and a greater freedom from narrow dogmas and theories.

STUDENT

Is Life a Series of Fermentations?

Physiology's present answer to the old question is, very simply: life is a series of fermentations.

THIS is one of the liberal and facile generalizations inspired by enthusiasm over the yeast cell. The yeast cell is analogous to the cells that compose living bodies. But it was found that the substance in the yeast cell has the same fermentative power as the cell itself. Büchner mixed barm with very fine sand and subjected the whole to great pressure; the cells were crushed, and the liquid which flowed out fermented saccharine solutions. Hence it is said the action of the yeast cell is due to an "enzyme." Later we acquired the terms diastase, zymase, invertin, ptyalin, etc.; but, as a writer says:

Like many other *termini technici* with which we are familiar, these expressions, ferment, diastase, enzyme, or what-not, must be understood historically.

One biologist even bids us associate the taking up of oxygen by the lungs with the necessary presence of an enzyme, which he has called *oxydase*.

Some chemists have been able to imitate very closely certain fermentations by means of finely divided metals, such as platinum and gold; and these ferment-like solutions may be poisoned, chloroformed, or killed, "just as if they were alive." Are molecular actions vital, or are vital actions molecular? Is life fermentation, or fermentation life? The biological, chemical, and physical maps of the world need co-ordinating and reducing to a

common scale, or key of interpretation, surely.

Fermentation is destructive; yet, side by side with destructive processes, go constructive processes. And constructive ferments even have been discovered, it is said—ferments which will re-combine the constituents which other ferments have separated.

Scientific writers on this subject seem to be glowing with the expectation of startling discoveries, on the brink of which they appear to stand. But they will eventually arrive at a verification of pre-Christian beliefs. They will discover that the units, both in the mineral and the organic kingdoms, are living beings, endowed with volition and purpose. Further analysis than that can only conduct us into the region of psychology.

Theosophy teaches that the whole universe is made up of lives—living beings. Every day research confirms this more and more. Right here we have the "creators" and "destroyers" mentioned, and are thus getting in line with the ancient Aryan Brâhma, Vishnu, and Siva. The introduction of scientific research into the realm of mind, the researchers being persons duly qualified for such research by freedom from the ordinary weaknesses, is a necessary supplement to ordinary science.

STUDENT

Artificial Cyclopism

IT may interest students who have read what *The Secret Doctrine* says about the "third eye" in some early races of humanity, and its curious analog in certain extinct animals and a few surviving ones, to hear of some scientific experiments in this connexion. "Cyclopean" monsters occur occasionally in the human kingdom and other species of mammals. But lately they have been produced artificially. The experimenter placed the eggs of a marine fish *Fundulus heteroclitus*, in seawater containing an excess of magnesium salts, and the fish had a single eye, situated in the median line of the face. In no case was the Cyclopean eye due to a fusion of two originally separate eyes; the theory is that the magnesium acted anaesthetically in arresting the development of the optical vesicles and thus preventing them from separating.

It must be understood that we are not joking but merely reporting when we add that these facts have suggested to the experimenter the hypothesis that the production of all Cyclopean monsters, human and otherwise, is due to an excess of magnesium in the mother's blood or the amniotic liquor!

Could Shakespeare's genius, then, have been due to his mother's predilection for turnips, in which later analysis of the Stratford soil showed traces of barium chloride? T.

The Thin End

THE United States is about to be invited by certain of the other Great Powers to join with them in contribution of warships towards an international police fleet. It is the move next following upon the Arbitration Treaties. The proposed fleet, if formed, and whether or not finding any actual police work to do, would be a most effective hint and object lesson. Put under the control of the Hague Tribunal, it would soon be a welcome suggestion to every people on the earth as a means of halving or quartering their military budgets.

H. C.

Some Views on XXth Century Problems

Our Conceptions of Death

DEATH is not a favorite subject of conversation or of meditation, and imagination, when allowed to occupy itself with it at all, usually takes a very morbid line. The spectacle of the ordinary funeral is almost enough to drive sensitive children into a lunatic asylum, and it does cloud the whole of their lives. They hear their parents talking of being "laid under the sod," and they see the broken columns and extinguished lamps where-with we used to ornament our burying grounds.

We should surely take some healthier attitude respecting so important and inevitable an event. Nor should our minds be in the least clouded by the word inevitable. We should sanely reckon with death in advance and draw its sting — if there be one.

Suppose, instead of defining death as a cutting-short of life, we consider it as a *withdrawing* from *flesh* life. Then we can consider how much life, and what sort of life, would inhere in what withdraws. Our work would be, to do the withdrawing in imagination. And in the mere emendation of the definition, in compelling the mind to accept the emendation unreservedly, we should find the sting withdrawn.

There are times when the withdrawing begins of itself. When we listen to fine music the body sometimes sinks entirely below the floor of attention. Its appetites and feelings become quite quiet and consciousness is manifestly *freed* thereby, glowing more intensely. Memories also are stilled and we may even become unaware of the room in which we sit. Going a little further there is now nothing in the field of consciousness to which we should apply the word knowledge in its ordinary sense, yet consciousness is aware that it has attained to a new and very high form of being to whose further heights there is no limit — nor any hindrance to attainment except the feebleness of its own wings.

If at that moment in its intensest degree the body should cease to be, and with it the soul's now stretched ties to the objective, the event would be death — and *freedom*.

The sinking of the body below the field of attention does not seem so impossible a phenomenon when we reflect that it often occurs to the soldier in battle so thoroughly that he does not know he is wounded.

The moment of death, then, is the moment when nature withdraws the body, acting in co-operation with the soul, which latter is then enabled to occupy itself with its own forms and fields of being. It is in fact a meditation in the old sense, the opportunity for which is conferred by nature. In the intervals between lives she gives us as it were samples of that ineffable freedom in true being which, sometime, we shall gain for ourselves *during* life.

This conception is of course very incomplete. Much must be added, among other things that the soul carries with it the essence of the memory of all that *it itself* felt and thought and did in life, that is to say all the thoughts and deeds and feelings that were high and pure, that came from its nature — in contradistinction

from those that were prompted from below and with which it may nevertheless have identified itself during life. For life is generally the confusion of the soul, of the incarnating soul, the ray from the purely divine soul beyond, the "Father in secret" of Jesus.

Looked at in this way, death appears as an utterly beneficent event. Imagining it in this way appears as one of the methods of learning what the soul is, or rather, what we are as souls. Life may and should, and death does, enrich the soul; the one enrichment being won, the other conferred.

But the other and ordinary conception of death, as a *cutting-off*, makes of life merely the steps to a scaffold and nature as the ax-wielder standing thereon. We ought to do better than that. STUDENT

Reaction

WE are never told, remarks a philosophical critic, that the Greeks suffered from reactions. They enjoyed their music, their plays, their art; but we do not read that thereafter the common life was stale and flat. Perhaps they took the view that their enjoyment of beauty was to be an aid to common life, instead of, as with us, a relief from it. The difference may not look great; but it is the difference between reaction and no reaction, between a narcotic and a tonic. Watson voices our aesthetic experience:

As one whose eyes have watched the stricken day
Swoon to its crimson death adown the sea,
Turning his face to eastward suddenly
Sees a lack-lustre world all chill and gray.

So I, from drifting dreambound on and on
About strange isles of utter bliss, in seas
Whose waves are unimagined melodies,
Rose and beheld the dreamless world anew;
Sad were the fields and dim with splendours gone
The strait sky-glimpses fugitive and few.

It is good to have the very quick and nerve of beauty touched in us now and then, but not unless we know afterwards what to do. We have *not* known, if common life is made grayer and weightier than before; nor even if common life is merely what it was before, like an instrument upon which the playing has merely ceased.

We looked *out* for the beauty, to a symphony, or like Watson to a sunset. But in what, within, was the sense of beauty stirred? Suppose we tried to find within, the supporter of the sense of beauty, that which reigns on the other side of the animal line. The stirred sense, with practice, may be made never to sleep again; the wells of real life may at last be found. The sense of beauty is one of the paths to the true consciousness which is beyond any shock from the world and is not dependent for its lights upon anything, any stimulus, that the world can give. It was a Mystery-sentence that the Christos was made to say: "Come unto me all ye that labor and are heavy laden and I will give you rest." When it is begun to be found, all duties are transfigured.

We are so much accustomed to rely on external stimulus that we never follow beauty inward to find what comes out to meet it and

crown it. Yet we are sometimes conscious that long after great music has ceased, perhaps for all the next day, deep in our natures an ecstasy remains whose lessening pulses come out upon our attention as phrases of what we have heard. Then they come no more and we are no more conscious of that deep fountain. But it is we that have come away from it; it is still there. The transformation of life is done by keeping the channel open, by searching inward along the path of the sense of beauty, by keeping the outer life clean and full of high action to correspond, and by the sustained compassion and brotherliness in every direction which burns up impurity. All that is the "coming unto me" which gives not only rest but light, wisdom, and power. It is no drudgery to a mother to be all day making straight the room in which her son from oversea will sleep; something in her heart makes every movement a joy. It is that sort of joy which from the beginning of the finding of the Christos fills the heart and life. STUDENT

Methuselah

HOW old was Methuselah? The *Jewish World* discusses some recent criticism of the patriarchal ages, perhaps designed to diminish the difficulties of those who desire to maintain their faith in the old Jewish records. One of these difficulties is the length of days given to Methuselah, Noah, Jacob, etc.

The solution is found very easy. Suppose that in the earliest times the month, the lunar cycle, was called a year. It is then only necessary to multiply twenty-nine and one-half days by the number of years given and reduce the product to years of 365 days. By this method the age of "Adam" (960 years) becomes about 75; that of Methuselah about 78.

As time went on — so goes the theory — the year became *five* of the lunar cycles, corresponding — according to the theory — to fingers on the hand. After that period the given ages must be reduced to five-thirteenths of their number to translate them into our years. Thus Abraham's 175 years come down to 72.

The word translated *year*, used with few exceptions throughout the Old Testament, is *Shanah*, which means a *repetition*, a cycle. But what cycle? If the Old Testament patriarchs are regarded as men more or less like ourselves, then this cycle must be made very short, as in the new suggestion. But if it be insisted upon as a year like ours, then the patriarchs must be shifted back to a period in human history — described in the legends of many peoples — when neither human life nor human stature had shortened down to what it is, when the "coats of skin" were half astral.

But the very names of the patriarchs, properly interpreted, may reveal the secret that besides connoting men they connoted great astronomical cycles corresponding with great stretches of human evolution. The old Teachers of many nations used names in this way, handing them over to popular care as they might hand over a stone upon which they had carved symbolic picturings to be interpreted in ages to come. EAST VIEW OF THE FAMOUS TEMPLE OF BOROBUDUR, JAVA

The Temple of Borobudur

SITUATED on a hill rising from the plain, it presents to the eye a perfect mountain of architecture. It is in the form of a gigantic terraced pyramid in *seven* stages. Round the base of the temple runs a pavement of uncemented stones, which, having been removed in sections, disclosed underneath another terrace, larger than the others but not so completely sculptured. An archaeologist infers that the builders made an engineering blunder and, finding their foundations insufficient, had to turn the ground-floor into a foundation! The engineers seem to have been competent enough as regards the rest of the structure, however. Students who know of the term "eighth sphere" will see the meaning of this subterranean eighth story.

The lowest of the seven stages is 497 feet square. On the summit of all is a cupola 52 feet in diameter. The entire temple is covered with sculpture of the greatest richness, detail, and elaboration. There are over three *miles* of bas-reliefs, which comprised originally 2141 pictures of infinite variety and consummate art. To mention only one detail — on the outside of the wall of the second stage there are 104 niches, each with a statue, and between the niches are other statues; and inside the same wall are 568 bas-reliefs.

The whole of this work is executed in the hardest and most intractable kinds of lava and trachyte, and Professor Alfred Russel Wallace remarks that:

The amount of human labor and skill expended on the Great Pyramid of Egypt sinks into insignificance when compared with that required to complete this sculptured hill temple in the interior of Java.

All the Buddhas in this temple are called by some archaeologists Gautamas — as if there never were more than the one Buddha. But

many successive Buddhas have always been recognized, as scholars know. It is also argued that the builders were not able to build arches, because they did not build them in these temples. But their engineering knowledge, ingenuity, and skill must have been equal to far more difficult tasks than that, or they could not have built such temples at all.

Such evidences as this — and there are many — of the greatness of ancient civilizations are usually quietly ignored by historians; nor, when they do mention them, does it strike them that temples 500 feet square, built of trachyte elaborately carved over every square inch, cannot be the work of an uncultured people. If architectural achievement has so declined, is it not probable that other things have likewise declined? STUDENT

Whence Came the Americans?

THE author of a recent work on Mexico incidentally considers the question, "What was the origin of the first peoples of the Americas, and whence came the principles of their semi-civilizations?" He mentions the legends of the lost Atlantis, and recalls that Lord Kingsborough spent a fortune in trying to prove that they were the lost Ten Tribes of Israel. The generally accepted theory, he says, regards Eastern Asia as the source of emigrations to America; a theory supported by the resemblances in architecture, customs, religions, physiognomies, etc., etc., and notably in the systems of chronological computation used. But on the other hand, there is no analogy between the languages. The resemblance between the aborigines and the Hindûs and Egyptians seems to have come from a westward and not from an eastward direction, for the aborigines have nothing in common with Europeans or Africans. The

author has often been struck by the strong Japanese or Mongol character in the Mexican face. How and when they came, whether by Behring Straits or at a time when there was land connexion is not known. There remains the hypothesis that they are autochthonous, a word whose significance is sufficiently vague, whether on theological or evolutionist lines.

This particular problem is one of those where the ordinary theories prove inadequate to explain the facts. But it would be an error to consider this case by itself, when sidelights may be shed by a study of similar cases. The problem of race-distribution in Africa, for instance, is equally inexplicable on ordinary lines. In that continent we find the same phenomenon of races widely divergent from each other in some features, yet similar in others.

But all these problems can be solved by allowing more time. The analogies between the races in the New World and those in the Old do indeed indicate their community of origin; but that origin and the epoch of their divergence must be placed at a far remoter date than any which our present historical science is willing to grant. The races in Africa have been isolated in that continent for long ages, until they have diverged into their present variety; the many red races of the Americas have similarly diverged during long ages, though they all exhibit common characteristics differentiating them from races in the Old World and pointing to a common origin.

It is important to observe that facts which seem inexplicable by current theories merely serve to confirm and illustrate the teachings of Theosophy, which allows a far greater antiquity to civilization than is usually accorded. The Atlanteans have left in both hemispheres the traces of their mighty civilization and their great knowledge. STUDENT

The Trend of Twentieth Century Science

Life in Interstellar Space

THE chemist Sir James Dewar appears to have given the death-blow to the suggestion that life germs, of the size and quality of any bacteria or bacilli known to us, can cross space and pebble one planet from another.

The cold of interstellar space they can stand. Sir James took some of those bacteria which produce the luminosity of sea water and kept them for months at the temperature at which hydrogen becomes a solid, the lowest that we can produce in the laboratory. At the expiration of that time they were warmed and at once began to shine, resuming their lives where they had left them months before. So far as the temperature is concerned they could therefore cross space from one planet to another. It would be *light* that would kill them. For if, when frozen as we have said, they are exposed to blue and ultra-blue rays, their structure is disintegrated and when warmed they are found to be dead, yielding none of their radiance. Space is of course shot through with rays of this kind, and in a few minutes any traveling bacteria would be killed. But it does not follow that the same would be true for smaller or other forms of life. If smaller living units, those from which—as science is beginning to suspect, and as Theosophy teaches—bacteria are compounds or re-compounds, have a diameter comparable to that of a wave of violet light, there is no reason to suppose that violet waves would hurt them. The ultra-microscope is beginning to reveal the existence of such units. And there may be still more remote units of an order of substance not affected as is ours by spectral light whatever their size.

Chemistry thinks that at the degree of cold at which hydrogen solidifies, all life, all motion, all chemical action, ceases, is suspended. But the fact that at that degree the rays of violet light can kill bacteria shows the contrary. For the death of the bacteria shows that their protoplasm has been so perturbed, so chemically changed, as no longer to be able to function. In other words very active chemical action has taken place.

STUDENT

The Root Tone of the World

THE study of "Brownian Movement," touched on by Professor Rutherford in his recent British Association address, is leading physical science a long way towards an ultimate truth. He reminds us that

In 1827 the English botanist Brown observed by means of a microscope that minute particles like spores of plants introduced into a fluid were always in a state of continuous irregular agitation, dancing to and fro in all directions at considerable speed.

The smaller the particles the faster the oscillations. The thinner the fluid also, the faster they are; and they are fastest and amplest when the fluid is no fluid at all but a gas.

The character of the Brownian Movement irresistably impresses the observer with the idea that the particles are hurled hither and thither by the action of forces resident in the solution, and that these can only arise from the continuous and ceaseless movement of the invisible molecules of which the fluid is composed. . . . Perrin found that each small particle had the same average kinetic energy of

movement as the molecules of the solution in which they were suspended; in fact, the particles in suspension behaved in all respects like molecules of very high molecular weight.

The relatively slow movements of the relatively large Brownian particles are, then, the resultant of the excessively swift movements or vibrations of the innumerable molecules of which they, and the fluid, consist.

We cannot but go further, and see that the relatively slow motions of the relatively large molecules and atoms, are the resultant of the quite inconceivably rapid vibrations of their composing corpuscles. As soon as we have perceived that the corpuscles are also compounds, we must proceed with the statement.

Every vibration is the starting in the ether of an electro-magneto-luminous wave, and the present tendency of science is to regard the corpuscle as nothing but the starting-point of such a wave, as immaterial. Matter, in the ordinary sense, is thus resolved into an infinity of immaterial starting-points in the ether. Carry the same idea further. Imagine that science has resolved the corpuscle into minuter and correspondingly swifter *x's*, and those into others—and so on, back to the real ultimate units—still only starting-points of waves in some ether corresponding to them. Then we have a conception of the universe on its physical side: a sea of trans-ether, set into ultra-inconceivably rapid wave motion—ultra-light—at an ultra-inconceivably close-set number of points. The number, per unit of time, of waves, and, per unit of space, of starting-points, would be the key numbers of the present universe. This ultra-inconceivably luminous sheet (in three dimensions) would condense downward through the planes, the points aggregating and their resultant wave-emissions getting slower, until at last we had corpuscles and then molecules, largest aggregations, slowest wave-emissions.

Such is the perspective we get from a little extension of the lines now drawn by chemistry. The chemist has only to *sense* consciousness throughout the "sea," and some entirely new paths will open to him. His science will begin to pass over into a very lofty philosophy.

STUDENT

Yellow Science

ARE there *no* limits to credulity? Will the public believe *anything* so long as it is said by a man with scientific letters after his name? After a fashion, yes. They will take it in, a whole page of it, along with the rest of the Sunday newspaper, between breakfast and dinner. Some time ago we were hearing the pronouncement of a surgeon that it was now possible to exchange the heads of two men by a surgical operation, cutting them off and sewing them on the reverse bodies.

Now a French surgeon promises to make heroes of cowards. Cowardice, it appears, is due to a nerve running between two parts of the brain, the medulla and cerebellum. The simple maneuver is to dig in through the skull and cut this nerve. Perhaps there is another nerve that destroys peoples' sense of humor and makes them read this sort of thing without laughing. Let them, for heaven's sake,

have it quickly cut or torn out or paralysed in some way.

We talk of Yellow Journalism; let us talk of Yellow Science. Nearly as yellow as the above, but not so repulsive, is some of the quieter "science" served out Sunday by Sunday. The more the writer knows—up to a certain point rarely passed—the more objectionable his writing. It contains that half truth which cloaks and makes respectable the rest. The last we have noticed, in a Chicago journal, deals with solar heat. The readers are informed that it is generated by the contraction of the sun "about thirty-five square yards per annum," and that "learned scientists" tell us that it will remain sufficient for life during the next ten million years only. That all calculations and forecasts have been upset by discoveries connected with radium, and that for all we know the heat may last undiminished ten billion years, does not appear to be known to the writer.

Elsewhere we read that "the secret of life has been probed," the secret being that extra salt water or an electric current will start the development of a marine egg. The *egg's* secret counts for nothing!

The finance column, meaning so much to the pockets of the readers, is done by experts steeped to the eyes in their subject. The science column, upon which the *mental horizon* of the readers largely depends and from which so many are even trying to get some basis for a religion, is done by men who cram from a cyclopaedia, who sometimes seem unable to tell a patent mare's nest from a real discovery, and whose main aim is to find, or invent and work up, a sensation.

STUDENT

The Rhythm of Reading

SOME recent German experiments have been directed to determine whether we read words letter by letter or as wholes. It appears that the eye does not sweep the line in one continuous movement. It makes a set of movements, after each of which follows a pause. The actual reading is done during the pause, and the amplitude of the movement depends upon the reader and what is read. As an average it appears that the movement covers the space of about thirteen letters, being then followed by the pause. During this pause, one word—or words—on either side of the resting point are read as wholes and not by their component letters. The mental activity of the reader is one element determining the length of the pause; his familiarity with the vocabulary of the writer is another. The same elements determine the amplitude of the movement. If the reader is correcting proof the movement is very short, not more than four or five letters; and so also if he is reading a succession of letters that mean nothing.

The experimenters have not noticed what is probably the case, that in readers of little power of concentration the mental lapses occur at the pauses. Indeed anyone who will closely observe himself will note the constant tendency of the mind to do minute wobbles that are usually below the level of attention.

The Ruby Mines of Burmah

FROM the legendary Great Ruby of Ceylon, as big as a man's palm, says Perceval Landon in the *Daily Telegraph*, down to the £14,000 stone that Boucheron exhibited at Shepherd's Bush last year, every one of the famous rubies of the world came from a small valley tucked away among the foothills that act as sentinels to the long dividing ranges between Burmah and China. Mogok is far beyond Mandalay; and of the crowds of sight-seers that hurry round the world, a mere handful makes the journey to this historical field where Nature has strewn her richest treasure. Yet the journey alone, apart from the treasure, is well worth the trouble.

North from Mandalay the Pole Star hangs low and steady over the broad Irrawaddy all the way. The navigation of the first 40 miles is one of the most complicated things that ever puzzled a waterman. Only in the center of the deepest channel is there water enough, even for a flat-bottomed boat, and the channel writhes unseen from side to side of the river with an infernal ingenuity; moreover it will change its course in a single night, cutting through the former shoals and piling up the sand in its former course. As the last touch of civilization vanishes, the river closes together; the banks rise steadily, covered with densely-matted jungle, and only on some promontory does the spire of a temple jet upwards in a golden-tipped flame of white.

About 100 miles up stream Thabeitkyen is reached, and the 60-mile journey through the jungle and up the curving green flanks of the foothills begins. But the road is good and an enterprising firm has placed motor-brakes on it, which cover the distance in 7 or 8 hours; so that at nightfall the yellow lights of Mogok appear ahead, the electric lamps of the trolley-way from the Taroktan mine standing out among them like pearls among topazes.

All day and night the work goes on. In two shifts, from 7 a. m. until 5 p. m., and thence until 3 a. m. The ruby-bearing earth stretches almost everywhere along the Mogok Valley, and wherever this rich old-gold crumbling clay is found rubies are found also. Yet so well hidden are they that the offer is often made to the stranger that he may keep any rubies he sees, and no one is able to profit by it. But after the sticky clay has been hauled up and washed, the rich glow of the rubies is seen among the shingle in the sorting shed.

Besides the pure ruby, spinel or balas rubies are found in large quantities. Both the true and the bastard ruby are of alumina, but the latter has a slight admixture of magnesium which reduces its hardness and lessens its value by ninety-nine hundredths. But a few really magnificent spinels exist, one of them being the great Agincourt ruby in the crown of England.

These mines, which have been worked from time immemorial in the native way, and part of which are still so worked, are now mostly worked in the thorough and systematic modern way. A company grows rich, a crowd of

natives are kept busy and their district prosperous, and the vanity of the world is fed. Our present ideas limit the use of jewels to their beauty and to their value as evidence that the wearer is rich. Ancient belief—or was it knowledge?—regarded them as the shrines of deific influences and therefore as inestimable charms; and this belief still lingers as a superstition. But it is surely conceivable that a gem might enshrine great and precious powers which modern hands are unable to evoke, and that our neglect to recognize the mysterious value erstwhile attributed to it might be due to ignorance on our part. A talisman might be a talisman for those who knew how to use it, and but a shining stone to those who did not;

transcending them. Ruby in the slime, ruby in my hand, ruby in the king's crown! What art thou? A cosmos, self-contained, serenely unconcerned in my handlings, even as perchance the world I call Earth may be a jewel to the eye of some vaster being, and I but one of the molecules that vibrate to and fro? E.

Agricultural Tuition in Bohemia

ACCORDING to the Consul at Prague, Bohemia has a government system of traveling teachers of agriculture. Each teacher has several specialties; one may have dairying, hop-culture, and the scientific fertilization of meadows; another the care of grapes and vegetable culture. All landowners,

Lomaland Photo. and Engraving Dept.

A DAIMYO'S GARDEN AT FUKAGAWA, TOKYO

the cock of the fable had even less use for the pearl than we have.

Finally, may it not be presumption to assume that everything in Nature is designed exclusively, or even chiefly, for man's use? And cannot a rich imagination conjure up visions of whole races of genii and djinns dwelling in fairy palaces of crimson ruby or sapphire blue, all unaware of the existence of such a being as man? May there not be, in the exhaustless storehouse of Nature, room for other orders of life, as invisible to us as we are to them, fulfilling their destinies unhampered by our doings, just as we perhaps unwittingly make way for them?

At all events it is a great assumption to say that Nature ends with the limits of our own senses; for in doing so, in what should we differ from the fly on the leaf or the beetle under the stone? It is our privilege as men to know of our limitations; and, as knowledge implies power, that is the first step towards

farmers, teachers, and persons interested in agricultural questions are entitled to receive instruction, paying a small fee for the course, while the government assists those who are too poor. Women are taught fruit preserving, etc. The course includes forestry, irrigation, fertilization, the prevention and cure of diseases, the cultivation of vines, the keeping of poultry and bees, veterinary surgery, and the care of the home. The results are described as astounding; in forestry alone 7,000,000 trees having been planted. T.

A White Tigress

A WHITE tigress 8 feet 8 inches in length has been shot in Dhenkanal State, Orissa. The ground color was pure white, and the stripes were of a deep reddish black. The skin has been presented to the Rajah of Dhenkanal, who has had it mounted and placed in his palace. The shikaris say that it is the only white tiger they have seen.—*Exchange*

The Power that Binds

WHAT is the power that binds together men and nations? What is that power which shall ultimately link together the whole human race into one family?—not as they are now, rent with enmities, jealousies, race prejudice and the lust of supremacy.

The past century has seen the whole earth linked together as never before within the present knowledge of man. Can it be said there is a race, a people, or even a tribe unknown? Continents, islands, seas, none is unknown—almost one might say, unexplored—save in a few as yet unconquered spots in the Andes, and in Central Asia.

The dawn of the Twentieth century has witnessed a marvelous unrolling of the map of the physical world and a recognition of man's physical relation to his fellow man. And to the extent of this knowledge of the races and peoples of the earth, looked at merely from the standpoint of awaking to the knowledge of their existence, and because of it, has, we cannot say arisen, but deepened, our responsibility to our fellows.

A new demand is made upon us to recognize the tie that binds—yes, not merely the most cultured European or American to the keen and subtle intellects of the Orient, the product of millenniums of metaphysical research, and not merely these to the uncultured of their respective races, but right down the line even to the native races of Australia and of the Isles of the Pacific.

Is the statement too sweeping? Do we shrink from acknowledging a relationship, distant though it be, to the outcasts of humanity, the last of the degenerate descendants of once mighty races? Yet Universal Brotherhood means all that and more.

It is one thing to give an assent to the statement of a truth and to recognize it as true; but it is quite another matter to realize it so fully, to feel the power that all great truths possess, that it compels action.

The tie that binds is woven of many strands, partly bright-colored, partly dark, some very dark, but in and out and around is one strand alone, one unbroken thread that stretches from eternity to eternity, around whose golden cord are twined the others, obscuring it for the most part, so that in our day but little of its gleaming is seen or even suspected.

Conquest, commerce, the arts, science, philosophy, religion, are all strands of the tie that binds. Yet they bind only in part, and keep separate in part. Conquest engenders hate, yet it links the conquerors and the conquered with unbreakable chains that must be reformed in other lives, in a new race perhaps, where born together they become through mutual

service no longer conquerors and conquered but one people. One of the most potent factors in linking peoples together is Commerce; yet we find it engenders jealousy, fierce competition, strife, and is but a form of war. It binds, but oh, how bitterly it divides.

Religion—which in its root meaning has such a deep significance, “to bind back”—surely here is the tie that binds! But the pages of history are stained with the record of religious wars and persecution. The Christian says his religion is the only true one, and so he sends his missionaries out to the “heathen” in all lands. But the Hindû, the Buddhist, the Mohammedan, each says his religion is the true one and their missionaries also go out to the ends of the earth. Are these also but strands of the tie that binds? Do they also serve to hide and only partly reveal that endless, unbroken golden cord?

there is to be found at the heart of all the great religions of the World one identical teaching; that they are all branches sprung from one primeval root; that they are, as it were, the prismatic rays of the one White Light—utterances in different tongues, to peoples of different races with different customs, of the one Truth—the ancient Wisdom-Religion. There is our common humanity, there are the same teachings, could we divest them of their outer racial garb, and there is the one Invincible Power, the eternal Unbreakable cord—the Divinity of Man.

Not conquest, not commerce, not philosophy, science, nor religion as conceived of today, can awaken man to his responsibilities to his fellow man, but only a recognition of the pivotal fact of his nature that he is at the very center of his being divine. And this is the pivotal teaching of Theosophy. STUDENT

CADETS OF THE *TAISEI MARU* IN THE GREEK THEATER, POINT LOMA
Listening to an account of Katherine Tingley's Brotherhood Work in all parts of the World

To one who is earnest in his desire to help his fellow man, who feels a binding power does exist, yet cannot trace it fully, nor see its windings through the maze of life, there are a few points that are worthy of deep consideration; but they must be viewed with an unbiassed and unprejudiced mind.

That all men are possessed of a common humanity, of certain qualities that give them their place in the human kingdom and not in the animal; is a fact that cannot be denied. That the same teaching on the broad fundamental principles of ethics has been given to all the great races of mankind—and inferentially to *all* races that have ever existed, though their degenerate descendants as above referred to may have lost all trace or knowledge thereof—is also a fact susceptible to proof. That, besides in the fundamental principles of ethics, the great religions of the world have many common meeting points, many convergences if not identity of doctrine, is coming to be recognized more and more. Does not a knowledge of these facts call for most serious attention? And to what conclusion do they lead?

It is one of the teachings of Theosophy that

Japanese Cadets in the Greek Theater, Point Loma

DURING the visit to the International Headquarters of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, at Point Loma, by the officers and cadets of the Japanese training ship *Taisei Maru* of the Imperial Nautical College, as already described, they were conducted round the beautiful grounds and shown many objects of interest. One of our illustrations is from a photograph of the guests in the Greek Theater listening to an address upon the life-work of Katherine Tingley and the objects of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY.

Katherine Tingley's position as successor to H. P. Blavatsky and William Q. Judge as Leader of the Movement was referred to; the International and Unsectarian nature of the work was fully explained, together with its first object, the promotion of Brotherhood in thought and deed between men and nations; a brief account given of the work of the International Brotherhood League under Katherine Tingley's personal direction in establishing a relief hospital at Montauk Point, and of the

aid given to the returning American soldiers after the Spanish War. Then followed a sketch of Katherine Tingley's first visit to Cuba with a staff of physicians and nurses and medical supplies, food, and clothing, and her immense work in relieving thousands of destitute Cubans in the Province of Santiago after the War. When the Leader's last trip round the world, in which she visited Japan, was mentioned, it was evident from the looks and words of the Japanese visitors that they were deeply interested and gratified to hear of the keen interest the Theosophical Leader takes in the advancement of their country.

On the return from the Greek Theater the visitors were taken to a high point of vantage whence they could get a bird's eye view of the groves and gardens of the Lomaland Forestry Department. As the cadets marched in military order out of the Homestead grounds, hearty cheers, "hurrahs" and "banzais" were exchanged between the guests and the students and Rāja Yoga pupils. Everyone realized that the day had been memorable for the establishment of a new and stronger linking of "Hands across the Sea." *Sayonara!* OBSERVER

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question In a sermon recently given, an episcopal clergyman is reported as saying: "If Reincarnation be true, then the scientific law of heredity is false. If Karma be true, then the philosophy of remedial and educational suffering is false." I would like to know what answer the Theosophical Forum would give to this statement. M. E.

Answer Let us take the two clauses separately. *If Reincarnation be true, then the scientific law of heredity is false.*

To complete the clergyman's argument for him we must add: *But the scientific law of heredity is not false. Therefore Reincarnation is.*

The minister believes that the souls of men were created by God. Let us apply his own argument to this. If God created the soul of a child, "then the scientific law of heredity," which says that a child is the product of his *parents*, "is false." But it is not false. Therefore. . .

But, replies the minister, the law of heredity only applies to the body; the soul is another matter.

Precisely! But now he makes his own criticism meaningless.

I am thinking of changing houses. The one I am in, though suiting me very well and furnished as I want it, has been rather shaken by some earthquakes. There is an experienced builder in the town, whose most recent house, now nearly finished building, is very like my present one. If I give him an idea or two as to my needs he will finish it so as to accommodate me and my furniture even better than my present one does.

This all goes well and I move in.

The minister's argument will be that because the house fits me and I it, and the builder made it, therefore he made me too! This being put to him he says he was not referring to *me*. Which reduces it to the truism that the builder built a house. And Theosophy never said that he did not.

Theosophy does say, however, that two other factors co-operate with heredity in fashioning the physical tenement that will be the home of a soul. We have:

1. Heredity.

2. The influences ordinarily called "prenatal," to the working of which on the *physical* plane birth-marks are often ascribed. Parents sometimes make very injurious attempts to use these on the *mental* plane when they decide and will that the forthcoming child shall be, for example, an artist or musician. In such case the child may be said to be *born hypnotised* and may need years to throw off or outgrow the imitation of a talent which has been forced upon it or to which it has been forced to adapt itself. If the parents will lead the highest lives they can, keeping their mental atmosphere pure and harmonious, they are doing their part, the best, and all that is needed or proper. The way is clear for their inner selves to do work of which their personal consciousness in the ordinary case knows nothing and with which any direct attempts on their part to interfere are only injurious.

3. The influence of the soul which is about to incarnate, and of all the elements of mind and character which by the close of its last

tion of love for them as well as an imposition of responsibility.

The second clause shows less study of Karma than the first of Reincarnation. *If Karma be true, then the philosophy of remedial and educational suffering is false.* The minister seems to think that Karma is a "philosophy" of uncaused and useless suffering. It is on the contrary precisely the philosophy he indicates, though it includes more. It is likewise the philosophy of remedial *happiness*. Our only difference with the minister is that he will regard the suffering as administered by God, and we as called out by the very defects and imperfections themselves and tending to be curative of them—just as, for example, that suffering known as dyspepsia is called out by that defect of character known as gluttony; the relation between the two, the cause and effect, being Karma. Where the clergyman would say faith in God, we say faith in Karma meaning this: that when we find suffering coming upon us, yet cannot at once see to what defect it answers, we should nevertheless be sure that there is such a defect, look for it, look till we find it, look to find what quality

life it had acquired and developed. The molding work of these latter not only begins before birth but continues for years after.

The child, then, resembles its parents in so far as it comes towards such as can furnish it with a tenement nearest to its needs, as well as with a mental and spiritual atmosphere with which it is in harmony. This is the general Karmic rule, to be sometimes set aside because of other Karmic bearings. Reincarnation, so far from contradicting the principle of heredity, demands its truth—though, as we have seen, parents furnish much more than the physical basis. As a rule, the child incarnating into their care has been connected with them in other lives and its incarnation is in one sense an act of trust in them and a manifesta-

the suffering develops in us when we meet it bravely, and consciously co-operate with Karma in our own cure in the spirit of gratitude.

The fullest study of Karma reveals the universe as beneficent, since the effects flowing back from causes turn out to be remedial and educative—that is, productive of growth, of wisdom, of unselfishness and strength and nobility, and therefore finally of happiness. Causes, in this sense, are called latent and active. The latent are the defects of character; the active, those actions or abstentions which result from them. But the latent are really active, since they provoke (Karmic) effects.

Karma is "the philosophy of remedial and educational suffering" and *reward*. STUDENT

THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l , O f f i c e P o i n t L o m a C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

Spirits and Bhûtas

THE great need for Theosophical knowledge is illustrated by a phase of Spiritism taking place in London under the auspices of a well-known but perhaps somewhat eccentric publicist. This gentleman holds a "Bureau" of communication, by means of which people are supposed to be put into communication with their deceased friends and relatives. The communication is managed by a certain "Julia," described as a deceased friend of the manager, whose "figure is seen by those who possess clairvoyant vision occupying the chair which is reserved for her." A short service is held, the applicant's desire to communicate is referred to "Julia," and, if she be favorable, he gets a message, either "clair-audiently," or through two automatic writers employed for the purpose. So far, we are told, 75 per cent have received evidence which has been the source of "infinite satisfaction" to them, and in half the number of cases the applicants have expressed themselves convinced that they have received tests satisfying them that they were brought into "communication with those they have loved and lost."

The practice of necromancy is of great antiquity, and has been condemned by the wisest in all ages. In India it is known and feared as "*bhûta* worship," meaning the attempt to communicate with the astral remnants of deceased persons, miscalled "spirits." The Soul, the real man, cannot communicate with earth in this fashion. It passes at death to Devachan, between which and earth there is no such communication; but it leaves behind in Kâma-Loka its decaying astral remnants. It is with these latter that the Spiritist communicates; though, indeed, in many cases, the communication and the supposed spirit are merely the production of the *medium's own astral body*.

If evidence be wanted of the truth of these remarks, one has only to point to the character of the communications received. The spirits never teach any philosophy, but merely echo the *banalités* and thoughts of earth, and in what they do say about life after death they disagree among themselves. They have never taught their votaries anything of permanent value; their communications are almost invariably frivolous and uninteresting. It is only too evident that such communications do not proceed from a liberated and

MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

spiritualized intelligence, or even from any thoughtful and sensible personality, but, as Theosophy teaches, from the mere remnant, the shell, of the deceased's lower principles, dying out in Kâma-Loka.

The consequences of such intercourse with the dregs of the astral world may be fatally disastrous to the sitters. For once an untrained and unguarded person opens the door, every kind of influence may rush in. And in the astral world are the relics of criminals, lunatics, drunkards, and all kinds of depraved beings, utterly devoid of conscience, because the *Spirit*, the immortal being, has passed on. Hence the sitters are open to obsession and to gradual deterioration of the nervous and moral balance.

Besides the spooks of the deceased, the astral world contains many entities not human in their nature, but possessing powers, faculties, and a sort of consciousness of their own; these elementals can produce various phenomena, acting in conjunction with the aforesaid human remains.

The power of the imagination must also be taken into account; for every thought or mental picture which a man makes is stored up in the astral light, and thus the alleged communications may be nothing more than an echo of the sitter's own latent memories and forgotten thoughts — "stored in his brain," as some say.

In view of the great danger to society involved in the practice of getting into *rappor*t with the astral world, it is a real necessity that people should know more about the nature of man, and study the Theosophical teachings on the seven principles of man, and on man's states after death. Then they would learn to distinguish between the Divine Soul, the immortal Ego, and the astral shade; and between the higher and lower natures of man. It is of little use for doctors to prescribe rules of hygiene, and for so much fuss to be made about health and education, when sources of possible contagion from Kâma-Loka are open. For the moral and psycho-mental harm which

can proceed from such a channel is much more serious than any physical contamination.

The undoubted good faith and good intentions of those who promote these practices should never be accepted as a guarantee of the value of the latter; for the promoter's ignorance is obvious and undisguised. It is to be hoped reasonable people will

realize that the idea that our deceased loved ones stand ever at the beck and call of anyone who chooses to hold a *séance*, is an idea that must be intolerable to anyone who truly loves and respects his friends. The nature of man is a sublime study, and affords pursuits much more worthy our time and dignity. STUDENT

Learning in Lomaland

IN the October issue of the *Metropolitan Magazine* (New York) appears an article by Katherine Tingley with the above title. The article opens with a brief sketch of her predecessors H. P. Blavatsky and William Q. Judge and the persecution they endured for the sake of Theosophy. Mrs. Tingley then tells some of the incidents of her own life, her search after truth, and her meeting with Mr. Judge; how after his death she found herself his successor; how she emphasized the necessity of putting Theosophy into daily practice, and how because of her insistence on this she raised up enemies against her even within the Society's ranks.

Her graphic description of the reorganization of the Society into the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY by which its teachings were safeguarded and it entered into a wider sphere of activity; her account of "practical Theosophy in War-time," the relief work of the International Brotherhood League at Montauk and later in Cuba; her account of Point Loma, its growth and development, and the life of the Students, all form an appropriate and wonderful setting to her main theme "Learning in Lomaland."

The keenest interest has been again and again manifested in the Râja Yoga system of education at Point Loma, and Mrs. Tingley's article gives an opportunity to all who desire it, to obtain authoritative information in regard to it and its possibilities.

The article is profusely illustrated by beautiful views of Point Loma and of the life there, and is sure to attract wide interest. J. H. F.

THE THEOSOPHICAL ADDRESS AT ISIS THEATER

AT Isis Theater last evening at the meeting of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, Professor H. T. Edge lectured on "Theosophy and the Religious Situation."

For many years Mr. Edge has been a close student of Theosophy and has studied under each of the three Leaders of the Theosophical Movement, H. P. Blavatsky, William Q. Judge, and Katherine Tingley. The following is quoted from his lecture:

We are an intensely religious people; and the universal stir that has been going on for some time in connexion with religion and the churches proves that at this particular time we are more than ever interested in religious questions. The demand of the people today has been summed up by saying that there is a generally felt desire for more reality in religion, and a prevalent feeling that the churches are no longer capable of satisfying that demand. A new conception of religion has sprung up. It is no longer an affair of creeds and dogmas, of observances and sects, but a something in human nature itself. And the question is more and more being asked, What have the churches and the formal creeds to do with religion anyhow? . . .

In short, all religion rests on the fact of the Divinity of Man; and that is the truth that is now being forced upon us. This is what the churches find themselves face to face with. Can the churches help man to find his true Self. Can they show him the way along the path that leads to a recognition of his own Divinity? The people, however, see that in most cases the churches and their pastors are just ordinary institutions and ordinary men, who know no more about these essential matters than they do themselves and are neither more nor less divine than other men. . . .

The churches maintain their hold chiefly by fear. It sounds harsh, perhaps, but it is true. They play upon our belief that their existence is essential to our spiritual welfare and that it is not safe for us to cut loose from them. . . . Another motive upon which they play is laziness. . . .

It is upon the basis of Theosophical knowledge that the nations of the earth must unite in a common religion that will bind all together in a general recognition of the eternal and universal laws of right living. Already there are students of Theosophy in the most widely differing nations, both Occidental and Oriental, and they find in Theosophy that common link. . . .

Is not religion that which binds the heart and conscience of man to his loftiest ideals of duty and nobility, leading him ever onward from the dark valleys of animalism and ignorance towards the mountain heights of knowledge and enlightenment? And can this be shut up in a creed? Surely true Religion implies a recognition of the good in our fellow man and of his kinship with us in a common perfectibility. There is in true Religion a certain largeness of soul, a certain courage, a certain expansiveness, that are not too often found in connexion with sectarian religions. An eagerness to pursue all paths of knowledge that lead toward the emancipation of man from his wolfish passions and delusions is a characteristic of the truly religious man.

And in saying all this Theosophy invents nothing new, but repeats the message of the ages. Science and archaeology have revealed to us vistas of knowledge extending back into the far past, and students of ancient lore find that the knowledge of the Wisdom-Religion has never been entirely absent from earth, even in its darkest cycles, and has been much more generally known than it is in our day. A revival of this ancient knowledge is what is needed to re-establish the true Religious spirit among the closely knit nations of today; and a universal recognition of the truths about the divinity of man forms the sure basis upon which we can found a moral law that will be binding upon all men.—San Diego Union

The Panorama of Religion

A Genuine Christian

A BISHOP says you can tell a genuine Christian by his street-car manners; and that the way you act is better than a theological test. Also it is what you do when you are off duty that counts; what we do when nobody sees us ought to be as beautiful as what we do in the open.

The bishop probably means that there is something special in Christianity that gives a man this power. But broader ideas will say that it is not the particular form of religion that counts so much as the spirit in which it is taken. The kind of man the bishop describes is the truly religious man, and he might be a Buddhist or a Mohammedan. He is the man who feels that he is ever in the presence of Deity and that the moral Law is a reality. He is the man who is inspired by the promptings of his inner Self, not by his sensitiveness to public opinion. The various formal creeds and churches cannot lay claim to be the original founders of this spirit in the human soul. They find it already there and they give it direction and often exploit it.

Vatican Financial Crisis

It is reported from Rome (Sept. 11) that the Vatican is passing through a financial crisis. The Pope is cutting down expenses by reducing the staff and lowering salaries. This has caused him deep regret, but was unavoidable because of the small receipts of Peter's Pence. "Certainly we live the simplest life," said the Pope.

The church will never perish, but it is passing through a critical economic stage. The expenses are enormous and there is no revenue to meet them.

This item, clipped from the daily press, gives weight to the statements as to the "decay of the Roman Church," made in a book which was briefly reviewed in a late "Panorama of Religion," in these columns.

Wealth of the Churches

RECENTLY an odd newspaper clipping came to hand in which the writer was combating the general lamentations over the decay of the churches, by giving statistics of the enormous capitalized wealth represented by church buildings and property in this country. This, he argued, is surely substantial evidence of a thriving interest in the churches.

But one should hear all sides. Ray Standard Baker, in *The American Magazine*, says he asked a prominent layman in New York what was the trouble with the churches, and was answered: "Money; we can't get money."

One billion dollars (\$1,000,000,000) has been given away for philanthropic purposes during the past ten or twelve years; but very little of it for church purposes. The millionaire donors do not favor churches, nor do the testators, nor yet the contributors of pennies; yet other institutions are lavishly supported by all classes. The churches have had to resort to the keenest business devices to raise funds, there being even several books published on church advertising.

This other side of the picture seems to show that the above-mentioned real estate represents *bygone* enthusiasm, and that at present it is rather an incubus than a source of revenue.

Baseball Sermons

THE movement to hold religious services on baseball grounds, before the playing, has been initiated by a clergyman who preached to

a crowd of 7000 just before a match between two large cities. Those who could hear listened interestedly—but then it was a novelty. The preacher, as we gather, eulogized baseball in his sermon.

This willingness of the church to serve, to accommodate itself, to be all things to all men, should not be lost on the public mind. For it shows that the public has the whip hand. Where the public leads, the churches will follow. Religion originates in the inner being of man, and a church is a society formed by man to organize that religion. But usually it oversteps its limits and undertakes to manage men's faith and to dispense grace and salvation; in which process the public, by its laziness, concur and abet.

Some churches try to make up for the lack of evidence of their present merits by pointing to the merits of earlier churches, from which they claim descent. But the public judges trees by their fruits, and argues that if the present churches are really of divine formation, they ought to show it. And they find the present churches following and not leading; which is a sufficient sign that the evolutionary spirit is no longer working through them but through other channels.

Religious Epidemic in Australia

THE religious press in Australia chronicles the phenomenal results of the revival work being carried on there.

The leading men of all the churches—theological professors, graduates from many universities, popular preachers, beloved pastors—on their knees, weeping and sobbing as if they were children.

At one meeting 100 tramcar men were converted—it seems to go in batches. It is the one topic of conversation everywhere. There are thousands both at the Sunday and weekday services. Outside of the meetings sporadic conversions are taking place everywhere. One lady had both the cook and the groom converted in her own parlor. But the most surprising case is that of a leading fortune-teller and clairvoyante, who "found Christ in her own rooms near the hour of midnight."

The psychic wave seems to span distances, attacking people in their own homes. It is of the emotional order, of course; the clairvoyants and cooks, the batch of tramcar men, and all—they were not convinced by an illumination of the understanding, but by a sudden emotional current that seized them. Probably they call it the Holy Spirit; but it does not answer to the description of that influence given in the Bible.

How weak people still are in this Twentieth century, to be liable to sudden conversion to a state of mind which they ordinarily sneer at. Soon the inevitable wave of reaction will follow in the wake of this revival; the emotion will have spent itself, the nervous system will be weakened, and there will be no rock of faith on which to anchor, any more than there was before the revival, for it will have brought no new enlightenment.

The revivalist has the power to excite people's nerves and emotions; but he cannot awaken permanently in them a calm, deep, abiding love and faith. To do that he would have to have some other message than the stale old "gospel." He would have to be able to show people their *spiritual* nature and con-

vince them of the fact of their own divinity. He would have to be a man of *knowledge*.

Was Jesus an Aryan

THE theory advanced by a divinity professor that Jesus was not a Jew, will seem to many people a piece of special pleading, such as one might find used by the opposition in a debate on the motion, "Resolved that Jesus was a Jew." The argument seems to run as follows: Jesus was a native of Galilee; the natives of Galilee were not Jews; therefore Jesus was not a Jew; which is what is known as a *non-distributio medii*.

Without further reasons, therefore, it is not much use laboring to prove that Jesus was born in Galilee or that the Galileans were not Jews; for, though both of these might be true, still Jesus might have been a Jew. However, the desire to maintain that Jesus was an Aryan seems to be so strong that the argument is proceeded with. It probably involves denying that Jesus was born at Bethlehem—a great heresy, surely. Yet we are told that Canon Cheyne, of the Church of England, believes this and is not expelled, and that many other authorities share his view. It also involves denying that Jesus was descended from David—another heresy. A further implication, of course, is that the passages representing Jesus to have been born in Bethlehem and to have been descended from David were put in by interested parties. This is a dangerous game to play at, because other people may play at it too, and it would be disastrous to allow each critic to prune away to suit himself; the whole story of Jesus might disappear at that rate.

The only shred of evidence for Jesus not being a Jew, which appears in the account of the professor's views, is that the bystanders said to Peter, when Jesus was on trial: "Surely thou art one of them (Galileans); thy speech bewrayeth thee"; which may be taken to indicate that Jesus, in common with his disciples, spoke a broken "Hebrew."

In considering the question of Jesus we must bear in mind the distinction between the *Christos*, which is an ancient symbol of the Mysteries, and the man Jesus. The question as to whether there ever was a historical Jesus is wrapped in inextricable mystery; but, if there were, it is not likely that the accounts give at all an accurate picture of him.

Yet even this picture has been depreciated by subsequent tradition; for the Gospel accounts represent a manlier and nobler Jesus than the one with which we are so familiar. This later, somewhat mawkish and sentimental Jesus is one that the world could well do without. Of course there are many Christians who have a better ideal of Jesus than the common revivalist ideal; yet even with these the ideal lacks in virility.

The most important point in Jesus is the one that is most forgotten—that he was an example to men. The Gospels which Occidentals profess to revere, represent Jesus as dwelling continually and forcefully on the point that other men might, if they so willed it, follow in his footsteps and become divinely wise and potent like him. He seems to have had an inner circle of disciples whom he taught in secret. Yet nowadays he is represented as a unique and inimitable personage, of little or no value as an example to man because he had the advantage of infinite divinity.

Theosophy does not take Christ away from Christians; on the contrary, it urges them to restore a fallen ideal and to replace the Christ of the churches by the real Christos. Let them know that whether the particular Christian Jesus ever lived or not, does not so much matter, since there have been many other Christs that did live; and that all men are potential Christs. And let them conceive of the Christos as a figure of power and knowledge, and not as the weakly character under which he is usually represented in his portraits. STUDENT

London Correspondence

A DISCOVERY of great antiquarian interest has just been made at the Guildhall, London. The interior of the venerable hall has been undergoing a process of cleansing, and the paint and stucco with which the stone work was covered has been removed. Inspecting one of the decorative parts on the southwest corner the City surveyor noticed a considerable space on the wall which had apparently been cemented up. Thinking there might possibly be something interesting here he got permission from the authorities to investigate, with the result that an old fifteenth century window, with diamond panes and the glass intact, was brought to light. It is 9 ft. 6 in. in height, and 6 ft. 6 in. wide, and is divided in two by a stone mullion. There were indications that there might be a similar window at the opposite end of the hall, and this proved to be the case; but the second window was not found to be in such a good state as the first. The windows are said to be the only remaining windows of the original structure, which was erected somewhere about 1420. Experts have pronounced the glass to belong to 1820, and the windows were probably built up by Dance, who rebuilt the Guildhall.

It is hardly necessary to say that the walls will not again be covered, but will be left to harmonize with the old bare stone-work which surrounds the newly discovered windows. The cleansing of the walls has brought into evidence some of the effects of the great fire of London, and these, together with the windows so accidentally and fortunately discovered, are attracting the attention of many hundreds of Londoners and visitors with a taste for the antique.

"When Doctors Differ—"

IN an old English diary (Thoresby's) there occurs an entry under a date in May 1714, recording a visit of the diarist to a meeting of the Royal Society "where was Sir Isaac Newton" and "several of my old friends, Dr. Sloane, Dr. Halley, etc." But, says the writer, "I left there to go with Mr. Chamberlayn to Bartlett's Buildings, to the other society, viz., that for promoting Christian Knowledge, which is to be preferred to all other learning."

What a certainty there was in those earlier days as to what constituted Christian knowledge! What a general agreement as to what was "the Gospel!" And what a change has been brought to pass on the old positions by the other knowledge of which the diarist spoke somewhat disparagingly. He would be a bold man who would undertake to say what "Christian knowledge" is today; and it would be very easy to produce at once another authority to say that he did not agree with the description.

For instance: two doctors of divinity preached in London on two successive Sun-

days this summer to vast congregations. One of them in his sermon accepted the erst-while orthodox view of the genesis of the human race, and the idea that

In Adam's fall
We sinned all.

But alas! for the identity of thought in matters essential; the other "doctor" inclined to the scientific theory that the primitive man was a savage, whose religious instinct was aroused by the dreadful thunder in the heavens above him. And both these men, be it noted, were doctors—of divinity. It would seem to the intelligent foreigner that they could hardly both be true; and yet they were doctors of divinity, and therefore supposedly in the possession of a certain amount of the Christian knowledge which the diarist was so anxious to promote.

A former Prime Minister of England (Lord Melbourne), on a memorable occasion, at a Cabinet crisis, turned the key in the lock, put his back to the door, and said, "Now gentlemen, let us make up our minds what to say. I don't care what tale we tell, but it must be the same tale!"

It would perhaps be an advantage if doctors of divinity could agree among themselves as to the essentials upon which they are alleged to be united. At present some entertainment, if not edification, is to be gotten from comparing what Dr. A. says with what Dr. B. says. The question of the origin of the human race has surely some bearing upon the doctrine of the Fall, and on the theory of the Fall rests the necessity of the "scheme of salvation" we were all familiar with in the days of our youth. Greatly daring, H. P. Blavatsky brought to light the Theosophical teachings on the genesis of man, differing from both the theological and the scientific accounts, and this is the century in which the justification of the ancient teachings she revived is to be seen.

It is a curious coincidence that in Bartlett's Buildings, where the diarist went to attend the meeting for promoting Christian knowledge, the Theosophical Society has its English depot for the distribution of Theosophical literature. Thus is Christian *knowledge*, as distinct from theory, being promoted from that center in the metropolis. LONDON CORRESPONDENT

Tempered Copper Again

A GAIN (September 11) the papers announce the rediscovery of the lost art of tempering copper. The discoverer is a blacksmith of San Juan, and copper razors and chisels are exhibited in proof. Last time it was a Denver jeweler. (See CENTURY PATH for July 18 last, page 6.)

Anyone can speculate on the uses and advantages of this discovery, supposing the facts to be as claimed.

There can be no doubt that some ancient races used copper tools for hard engraving work on stone. If we find we can harden copper ourselves, we may be more ready (though not very logically) to admit that they could. And will not this admission throw the orthodox thermometer of human progress out of scale? If the bronze age preceded the iron age, perhaps this indicates a *decline*. Perhaps the bronze age men threw away the iron as being rusty useless stuff. And this suggests that rustless iron may be a future possibility, as well as an item of past knowledge. T.

Art Music Literature and the Drama

WADA TEMPLE, KOBE, JAPAN

The Shinto Temples of Japan

BEFORE every Shinto temple in Japan stands the torii, that simple gateway which is so characteristic in form that once beheld it can never be forgotten. Its origin, antiquarians and authorities generally, assure us, is lost in the fire-mist of antiquity; but that it is symbolic is admitted by all. Students of symbology in the light of H. P. Blavatsky's writings, see in the outward sweep of the uppermost transverse beam a certain winged significance, as if it hinted of that Supreme Mystery symbolized in ancient days in the *Kāla-Hansa*, the "Great Bird" or "Swan" the "Bird of Life," to bestride which is to live and know, and between whose wings alone is rest, for there alone may one attain that life which is unfettered of selfishness by knowledge.

More readily the torii suggests "The Path," and it is strikingly similar to both ancient and modern symbolic representations of that gateway through which the Candidate must pass in order to travel the "path of knowledge," the only path leading towards the goal of love for all creatures, service to all, Compassion Absolute. The facts that the Japanese have placed this simple figure (see cut) before all Shinto temples since the earliest of historic days, and that its form has been kept unaltered through all the evolutionary changes that have

Furu ki wo tazunete atarashi ki wo shiru.

New things are learned by studying the old.

Japanese proverb

taken place in both architecture and art, show plainly that it holds some meaning deeper than that which antiquarians have yet arrived at guessing.

And how it always serves the landscape in which it is set, as the very trees, shrubs, stones, lake, and flowers seem to serve it! The Japanese never make the mistake of placing temple, shrine, torii, public building or home, even the simplest, all at odds with the scenic surroundings. Beauty is appraised at its true value in Japan, and natural beauties, above all, are not thought lightly of nor wasted. The result is a scenic and decorative fitness that one would travel the world over to find in such abundance and disturbed by so little that is garish, or commercial or merely commonplace.

The Japanese have learned, as the prodigal West has not yet, as a whole, although a fair beginning has been made, the spiritual significance of natural beauty, and in no land are the wooded lake, the gnarled pine, the feathery bamboo, the trailing vine and flowering shrub so prized and so appreciated from the standpoint of pure loveliness and artistic worth.

It is probably true, as a leading American architect and artist only recently stated, that no nation in the world excepting Greece can boast of an architecture so perfect in itself and of its kind as can Japan, and that not all our lavish West can produce architectural models that can compare, in the perfect union of utility and beauty, their perfect adaptation of means to an end, with the Shinto temples of Japan. The secret, we would say, lies in the simple harmony of temple, torii, and buildings generally (save where commercialism has touched the island to deform) with their surroundings. The charm is not to be found in the building alone but in the whole environment.

The Shinto temple speaks strangely of antiquity, and, walking beside it in the shadow of trees which carry a primeval air about them, the present vanishes and one wings backward in thought to the Yamato of elder days, the Fire-mist Isle, when the virgin-priestesses, daughters of the Mikado, guarded the sacred mirror, the jewel, and the sword, within the ancient shrine of Ise, treasures bestowed upon the dynasty by lofty Amaterasu herself, the Sun Goddess of prehistoric days. In a strange way the spiritual link in Japan's life, though often obscured, has been kept unbroken through the ages. Who shall discern why? And what of the future? STUDENT

Chiri tsumotte yama to naru—Dust, heaping up, becomes a mountain.—Japanese Proverb

As truer ideals of life and life's meaning have come to find wider and more general acceptance, many of the barriers that ignorance and selfishness have so arrogantly raised to hinder the onward human march have melted away as if by magic. As men's minds have broader grown the world has become smaller. As the human heart has unfettered itself of fear and burst the bonds of selfishness and pride, hand has clasped hand across the seas and the day is already here when height nor depth nor space avail to keep apart those whose brotherhood their own inherent Divinity proclaims.

What the railroad, the steamship, the telegraph and cable have done for the material world, the beneficent growth of a higher ideal for humanity—that ideal which was sounded as the tocsin of this new time by H. P. Blavatsky—has done for the world of thought and feeling.

The brotherhood of man! It had become a word for dreamers and the irresponsible when H. P. Blavatsky set pulsating throughout the entire world the currents of a new life by her courageous establishment of the Theosophical Society in 1875, the primary object of which was "to form the nucleus of a Universal Brotherhood." Brotherliness in act and deed! It was an ideal as far removed from the actual practice of the work-a-day world in 1875 as is Uranus from Earth. To-day the seed sown by that heroic soul has grown and brought forth an hundred-fold, for, when she had passed away, its care was entrusted to others who were equally consecrated to the service of humanity on the highest lines; to William Q. Judge first, and by him to Katherine Tingley.

Twice since H. P. Blavatsky carried the standard of Ancient Truth into the enemy's country has Katherine Tingley encircled the globe with a Crusade, her object being one with that of her predecessors, yet carried forward on the new lines and in the bolder and

In Touch with Japan

broader practical way that a later time made possible and indeed demanded. The first Crusade occurred in 1896-7; the second during 1903-4; and it was upon the second Crusade that Katherine Tingley made important and far-reaching connexions with Japan.

During the last month the visit to Lomaland of a body of Japanese officers and cadets from

GOOD MORNING!

the Imperial Training Ship, *Taisei Maru*, (mention of which appears also in other columns of this issue) was as the adding of one more link to a chain that is being slowly forged for the binding together of nations, the golden chain of a Universal Brotherhood.

Much that is of greatest interest in connexion with Katherine Tingley's work for Japan could not be written, nor is there space here to record the many interesting details connected with work there which could be given. That a great past, greater by far than they themselves know, is the inheritance of the

Japanese people Katherine Tingley declared many years before it became a pleasure as well as a duty to visit their shores. She then stated that time would reveal the existence of records, now unknown, which would throw new light upon the obscured early centuries in Japan's life, long before the dawn of what, by the records now accessible, we call history.

The following extracts from a letter written by Katherine Tingley while in Tokyo, Japan, at the conclusion of her second journey around the world, and shortly thereafter published, contain many hints that Students will understand—all indeed, to some degree, who are familiar with the tenets of the Wisdom-Religion which is known in this cycle as Theosophy.

It is not difficult to believe that there is still lingering in the life-blood of the Japanese people the golden thread of a mighty past—a glorious civilization—a time when the soul-life was the main-spring of all their progress. Who these people really are, and from whence they came, specialists in ethnology have failed to discover. The very mystery of their origin inspires one to dare to work out on lines of deep study the serious history of these interesting peoples. In view of known data, we turn our minds to ancient Japan, to about the Sixth century of our era, from which time approximately begins the admitted authentic history of the country. Behind that date, a veil of obscurity has closed in the prehistoric records.

But does that mean that they are lost? That some day under the touch of that Law which is the ever-guiding power in all human progress, they shall not be revealed and the missing links restored? . . . Who is there to prove that the sacred records of the origin and growth of these peoples have not been preserved?

We have but to study the Japanese seriously, impartially, to find a quality of devotion leading them which is part of their very blood. And this marks the now hidden influence of the past. In the highest sense, obscured as is now their spiritual teaching, one cannot dispose of some evidences among them of an interior spiritual life; a soul-impress that urges them to go beyond their knowing. Searching the oldest records of the antiquity of some of the Oriental countries, here and there is recorded testimony of devotion to sacred mountains. What think you of the revelations that the hidden and most

ancient records of the Himalayas might reveal? And even some of the old mountains of old America? Or of those older than all, now buried out of sight in the depths of the seas?

Atlantis and Lemuria are no longer visible to us; but they did exist, and Japanese people may still hold, in their inner courts, some of the wisdom of old passed on by word of mouth from their venerable ancestors. All along the ages, the seeds of truth are sown in the hearts of men. Some fell by the wayside and some on stony ground; but there is enough of these still left in the Japanese to hold them united in trust, in an unspeakable faith in their own divinity; and in a love of humanity that surpasses in many ways anything that modern history has written.

It is the urge of the old spiritual life that is teeming in the blood of the Japanese today; and a wave of spiritual devotion overshadows them, in their efforts for the real. They are advancing, moving towards a higher state. . . .

The history of Fujiyama, the mountain, and all

Meeting the visiting Japanese, observing their bearing and the courtesy which so evidently sprang from the deeper heart-qualities; more particularly observing the devotional and silent intentness with which they listened to the strains of their loved Japanese national anthem, as played by the Children's Orchestra, one divined something deeper than of this day and generation alone. A breath, a fragrance, savoring strangely of antiquity, filled the place.

Where now swell and purple the waters of the vast Pacific once rose the mighty continent of Lemuria. America was not—saving a strip along its now western coast which today is known as California. The Orient as we know it today was not—though some of the islands which now form modern Japan did then lift their heads above the waters. STUDENT

Jottings and Doings

(From a Student's Note Book)

THE Municipality of Rome recently presented Queen Elena with a plain little silver ring which, in spite of its lack of intrinsic value, the Queen declares that she values beyond any other gift because of the devotion and compassion it represents. It was found in a subscription box opened in aid of the victims of the Messina disaster, doubtless the "widow's mite" of some compassionate soul who had nothing else to give. Beside it lay a gift of \$5000, but who shall say, in the eternal order of things, that the latter was necessarily the greater? The Queen, it is stated, has entirely recovered from the injuries received while she was so heroically aiding in the work of relief during those first terrible

Lomaland Photo. and Engraving Dept.

SNOW-CROWNED FUJIYAMA, THE SACRED MOUNTAIN OF JAPAN

its past associations unrecorded, might give the world a startling story, as strange and wonderful as the stories of Biblical lore. . . .

Today, there do exist in Japan, deep in the mountain forests, those who have preserved some of the real and inner knowledge that belongs to the Japanese people. . . . In retracing their steps back and upward to the ancient Light, theirs is an easy path, in comparison with that which many nations must travel ere they reach the heights, for the Japanese people are not weighted down with the useless theological luggage of centuries, and with all the heavy Karma of the mistakes made in the holy name of God.

Is it the spirit of devotion, shown by the Japanese people to this beautiful symbolic mountain, impressed into the very atmosphere of its surroundings, that makes one feel its mystic charm? Or is it that somewhere near or about that mountain, at times, are found teachers sent forth to help the people by lifting the veil, little by little, according to their understanding; lifting the veil that shuts out the light of Japan's ancient glory?

May it not be that this delicate thread of spiritual devotion in the Japanese people will bring them ere long to another cycle, when shall be revealed through them, truths undefiled?

FUJIYAMA

The following exquisite English rendering of an old Japanese poem, the date of which must be placed earlier than the eleventh century and the authorship of which is unknown, is by Basil Hall Chamberlain, Professor Emeritus of Philology and Japanese in the Imperial University at Tokyo, Japan.

THERE on the border, where the land of Kai
Doth touch the frontier of Suruga's land,
A beauteous province stretched on either hand,
See Fujiyama rear his head on high!

The clouds of heaven in reverent wonder pause,
Nor may the birds those giddy heights essay
Where melt thy snows amid thy fires away,
Or thy fierce fires lie quenched beneath thy snows.

What name might fitly tell, what secret sing,
Thine awful god-like grandeur? 'Tis thy breast
That holdeth Narusawa's flood at rest,
Thy side whence Fujikawa's waters spring.

Great Fujiyama, towering to the sky!
A treasure art thou, giv'n to mortal man,
A God-Protector watching o'er Japan---
On thee forever let me feast mine eye.

weeks after the earthquake. The gift of the ring, coming as it did, from the members of the Municipal Council, could not but stir an answering voice in her heart. We call our age materialistic, but it cannot be wholly so.

A DELIGHTFUL example has been set before any explorers or discoverers who may need it—if such there be—by the amiable way in which the world's two most famous Alpinists among women, Miss Annie S. Peck and Mrs. Bullock Workman, have settled a little controversy, started by friends, as to their respective records. Miss Peck smilingly said, "Are there not honors enough for all? The important thing is that the record has been made, not whether this or that person made it." Miss Peck's most remarkable feats have been performed in the Andes, under unparalleled difficulties and dangers. Mrs. Workman's record in the Himalayas is only rivalled by that of the Duke of the Abruzzi. Both have made modern science their debtor.

OUR YOUNG FOLK

The Hudson-Fulton Celebration

NOW that the great Hudson-Fulton Celebration has taken place in New York and the interest of the country was centered there and thousands of visitors from all the States and from foreign lands assembled to witness or to take part in the festival, one must stop and think what is the import of it all.

All of us have read something of Henry Hudson and of Robert Fulton, but did you ever realize what an influence they have had on history? Of course we know that the northern shores of America would have finally been explored had Henry Hudson turned his attention to things other than navigation, and that we should have steamships now had Robert Fulton been satisfied with painting miniatures, which was his trade; yet greatest honor is due to the pioneers in discovery and invention.

Hudson was an Englishman born in the time of Queen Elizabeth when all nations were burning to find a northwest passage to China and India, so that their trading vessels would not have to double the Cape of Good Hope, a voyage of 16,000 miles. Hudson made two unsuccessful attempts to cross the ice-bound arctic seas in the interest of English merchants, so they lost faith in him and refused to back his enterprise with further supplies. He therefore went to Holland, then one of the greatest maritime powers in the world, and in 1609 was fitted out by the Dutch East India Company. His little boat, the *Half Moon* was manned by Dutch and English sailors, who, when they found themselves in the frozen seas of the north, mutinied, and Hudson was compelled to turn southward, thereby discovering the northern shores of North America. He sailed into New York Harbor and up the Hudson River.

On his last voyage, when he discovered Hudson Bay, Hudson believed at first that he had found an opening in the continent that would let him through into the Pacific.

CADETS FROM THE JAPANESE TRAINING SHIP *TAISEI MARU*
ENTERING THE GROUNDS OF THE RAJA YOGA ACADEMY

After spending a winter ice-bound in the bay, his mutinous sailors bound him and his son and the few who were faithful to him and set them adrift in the waters to perish.

The Dutch took possession of these discoveries, Manhattan Island, the Hudson River, etc., and planted a colony called New Netherlands, its capital being New Amsterdam (now New York). Dutch was more commonly spoken than English in this part of the country until the Revolution and New York is still full of Dutch names, faces, and characteristics.

It has been just 300 years since Hudson in the *Half Moon* sailed into New York Harbor and up the river; just 100 years since Robert Fulton in the *Clermont*, the first successful steam-boat, steamed up the Hudson from New York to Albany. Fulton never claimed to be the inventor of the steam-boat, but to his knowledge of mechanics, his resolution, and

perseverance, are due the final triumph of the invention. When the *Clermont* was launched for her trial trip crowds assembled to witness the performance, but few seemed to have the slightest faith in its success. The enterprise was spoken of as "Fulton's Folly," but the jeers of the crowd were changed to cheers as the *Clermont*, spouting smoke and sparks from her little stack, moved easily up the river.

The Hudson-Fulton Celebration honored these two men and their impress on our country. All nations were represented in the pageant, and New York Harbor was filled with foreign battleships come to do honor in the naval parade. The city was in gala attire. All along Fifth Avenue and Broadway were arches and columns hung with millions of electric lights. Flags and banners waved from windows and doorways. Shop windows blazed with Hudson-Fulton and North Pole souvenirs. A candy shop window had a representation of the *Half Moon*, its captain and crew, Indians pushing out from the shore in canoes or swimming out to meet the strange ship; squaws and papooses sitting in the doors of their wigwams in wonder—all made of candy. The windows of a toy shop gave a panorama of the Frozen North with Esquimaux standing outside their igloos, or being drawn over the ice in sledges by dogs—all made of toys. Aero plane flights over the harbor and river were a very interesting part of the program.

The story of New York was told in the floats of the parade—New York in the times of the Indians; New Amsterdam of the Dutch Colony; New York in Colonial Days; and Modern New York. Of course there was a duplicate of the *Half Moon* and of the *Clermont* and a float representing the tragic fate of Henry Hudson. L.

THE CHILDREN'S HOUR

Brotherhood Warriors

"DADDY, come and find your child," called little May, on her father's return from his office, and she laughed to herself under the table as the search proceeded. Found at last, and on his knee—

"And where is my other child?" he asked.

"Maggie has been away all day," said little May, and her mother explained that Auntie Belle had taken her down to the seaside with some of her little pupils, and would bring her home tomorrow. How glad the mother was to see her little girl again next day and to hear all that had happened.

"We paddled in the water, and built castles in the sand, and Rhoda and Daisy and I rode on a donkey, and I wasn't a bit frightened," said Maggie, "though he did make me wobble about when he runned fast."

"Galloped, dear," corrected mother with a smile at the picture Maggie's words called up.

"And Charlie was so kind," the little girl continued, "he made us lovely castles and I know he would have liked best to go and play with the other boys. I could see it in his eyes when he looked at them, but he did not go until the castles were all finished. Auntie's little scholars are such lovely children to play with; they never quarrel nor snatch things."

"Once," said Maggie, and her face flushed, "I snatched at the spade Rhoda had, because it was the biggest, and she looked so surprised and let go at once and said 'Would you like that one, dear? I'll change,' and took my little one. I don't think snatching is nice either, do you, Mother?" Maggie looked so serious, and mother answered sympathetically, "No, darling, it is both rude and wrong."

Lomaland Photo. and Engraving Dept.

JAPANESE VISITORS FROM THE TAISEI MARU IN THE ROTUNDA OF THE ACADEMY

"I asked Auntie Belle, coming home, what made us want to be naughty?" continued Maggie, "and if her boys and girls never wanted to be naughty, they were all so good yesterday and we had such a happy day."

"What did she say?" asked little May with widely opened eyes.

"She said, 'Yes, sometimes they were, but they knew that the part of them that wanted to be naughty was not really they, but that we were all really Warriors and should fight the naughty part which was our enemy, until we had conquered it, by always doing right, no matter how often it tried to make us do wrong; and then it became our good servant, which

helps us to learn all about the world and the things in it; *the lesson they have for us*,' Auntie Belle said."

"Mother," said the little girl, "I should like to go to her school. She said the children were trying to be Râja Yogas and when I asked her what that was, she laughed and kissed me and said it was when the Warrior was king and ruler in our bodies—she tells such lovely stories. Couldn't we go to Auntie Belle's school?" pleaded little Maggie.

"We shall see about it, darling," Mother answered, and she and Daddy talked it over that evening and the upshot of it all was that they went to live in a new suburb, for Auntie Belle and her children had, through the power of their loving, unselfish lives, won two more little recruits in the growing army of Brotherhood Workers.

A Queer Place for a Spring

IN the Persian Gulf there is an island which is one of the hottest places in the world and, besides, has not a single spring of fresh water on it. What do you think the people there do for water to drink? Instead of finding water in some rocky place they send a diver down to the bottom of the gulf. There he finds fresh water gushing from the sea-bottom. He fills his bag and ties it up tight and carries the water up. It is thought that long ago the sea did not cover the place where the springs are, and that the story of the way to get fresh water was never forgotten, but was handed down from father to son until now. It is very fortunate for these islanders that the story was not lost, as they probably have no other means of getting drinking water today.

THE MYSTERIES OF THE HEART DOCTRINE

PREPARED BY
KATHERINE TINGLEY
AND HER PUPILS

The Theosophical Book *of the* Twentieth Century

Tells the story and the history of the Theosophical Movement.

The prices are \$2 in cloth and \$1 in paper, which barely cover the cost, for it is printed and bound, not gaudily, but with such carefulness and thoroughness of art and craft as to make it unique among modern edition books.

ORDER FROM THE
THEOSOPHICAL PUBLISHING CO., POINT LOMA, CAL.

Isis Conservatory of Music OF THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY POINT LOMA, CALIFORNIA

Personal applications and inquiries received every Saturday
by the Secretary at SAN DIEGO BRANCH

The 'Sub-conscious Ego'

JUDGING from the newspaper accounts one sees, there are societies, usually under the leadership of some one self-appointed person, whose declared object is to attain physical health and mental balance by means of arousing what they call the "subconscious ego" or the "subliminal self." It is claimed that this unknown entity is the fount of will-power, knowledge, and guidance; and that by relying on it, we can attain all sorts of advantages.

It is well known to students of Theosophy that the subconscious part of our nature is a large region including many different powers, not the least of which are various animal propensities. It has been well known to students of Occultism from time immemorial that the portals to Self-Knowledge are guarded by a formidable dragon which must first be encountered and overcome — the dragon of selfishness. Theosophists would express this by saying there are two egos — the factitious personal ego, the man of desire, which is the hidden root of our selfish and passional nature; and the immortal divine Ego, the source of all Spiritual aspirations, the real ruler of our destinies.

The True and Make-Believe Selves

The practices recommended for arousing this "subconscious ego" must inevitably result in arousing the passional ego, if they result in anything at all, and in thus placing us at the mercy of that powerful entity; and the so-called "will" that is aroused will not be the true Spiritual Will but the focussed desires of the personality, in conflict with those of other people.

To imagine that any part of our nature or mind which is subconscious must of course be good and beneficent, is to betray a woful ignorance; for there is an enormous amount of latent evil in human nature, as every competent observer of human nature must surely know. Consequently unqualified dabblers in pseudo-occultism are merely awakening the powers of the lower self in themselves, and if they have any success at all will certainly find out their mistake by the bitter lessons of experience.

The "Under-Self" ever Seeks to "Get Something"

For evidence of the truth of this, one has merely to point to the numerous cases of mental, moral, and physical wreckage as a result of wrong practices and teachings. People lose their judgment and begin to advocate perverted moral doctrines and to justify practices which the general consent of humanity condemns. We have seen people who claim to heal diseases by appeal to subconscious forces fall a

prey to insane fears and begin to accuse one another of exercising unseen malign influences, exactly like any patient in a lunatic asylum; and we have seen them, under the influence of these mad delusions, lose all sense of right feeling and justice towards their fellows.

It is clear that if these practices should ever become common in society, the result would be a chaos of delusion and suspicion, of hatred and fear, of neurosis and insanity.

The most dangerous feature of these doctrines is that they sometimes combine plausibility with ignorance and irresponsibility in a way calculated to impose upon the ignorant.

Borrowed and "Person-ating" Robes

It is so easy to borrow and quote (or misquote) Theosophical teachings, or phrases from the Christian Gospels, and to talk a lot of high-sounding stuff. And in such cases it is not always easy to refute this teaching, because, theoretically, it may be more or less sound. But in practice the teachings are not, and cannot be, carried out. We may preach about the Higher Self, and even enunciate sublime truths about it; but to *evoke* that divine influence is a very different matter; and a person who under the pretence of showing people the path to wisdom and emancipation, directs them to render themselves sensitive to the subtle forces of their animal nature, it matters not under what other names, is a quack and an impostor.

A sure sign-post of danger is the fact that *no pledge or moral guarantee whatever is required of the people enrolling themselves in such cults*; and the reason for this becomes obvious when we ask ourselves what power the leader would have to impose such a pledge or exact such a guarantee.

The Lower Is easily Aroused

There is still plenty of raw material in society for the gold-brick swindler and for the person who seeks money, power, or notoriety by becoming the leader of a cult. A large proportion of civilized humanity are eager to trust themselves, body and soul, to any person whatever who will undertake to lead them; and the confidence which they impose in their leaders is touching. But there are other people who value their independence and individuality; and no one who prizes these things will do anything that implies a surrender of his balance and self-control to any known or unknown power.

So soon as we lay down our self-control and sane consciousness and bid outside forces to enter and take possession, we have opened the gates to we know not what; and we are surely on the highroad to perversion and insanity.

To realize the danger to society involved, we

have only to consider what are the ruling motives in society today; when we shall speedily see that a large proportion, if not a majority, of people endowed with extraordinary powers, would forthwith use them to the advancement of their own imagined interests and the detriment of their fellows.

**The
Danger to
Society**

Theosophists, having always at heart the welfare of the race, can countenance no teaching that is not based on the firmest and truest moral guarantees, for else there is a danger of arousing the sleeping passion forces in human nature. Hence it will always be found that Theosophy insists primarily on a guarantee of unselfishness and willingness to do unselfish work, before it begins to teach any self-development.

There is only one way in which people can avoid feeding the dangerous forces of the personal ego and insure the help of the Spiritual Ego; and that is the good, old, pre-Christian way of self-abnegation. But this self-abnegation must not be understood as the entering upon a path of misery and austerity; for that is only a misrepresentation of it. Theosophists believe that the path of unselfish service is the only happy path, and in it they seek their joy and consolation. And verily the rewards in *Occultism* that attend the faithful follower of that path are worth more than the paltry aims which the dabblers in psychism set before themselves!

STUDENT

Inversion of the Earth's Axis

PROFESSOR H. H. TURNER, writing in the *New Quarterly* (London), revises the nebular hypothesis in order to explain the existence of a recently discovered satellite of Saturn, which revolves around its primary the wrong way.

The nebular hypothesis states that the sun, rotating rapidly in a gaseous condition, threw off rings which afterwards broke up into planets, the planets revolving about the sun in the same direction as the sun's rotation, and also rotating about their own axes in the same direction. The planets in their turn threw off satellites, which likewise revolved and rotated in the same direction. How then account for the existence of Phoebe, revolving in the contrary direction?

The theory that it is a picked-up body from space is negatived, partly because its orbit is nearly circular and nearly in the plane of the ecliptic—conditions which could scarcely obtain separately, much less together; and partly because Jupiter has a satellite which does the same thing.

The professor now says that the throwing off of planets by the sun would have the effect of making them rotate on their axes in a direction *contrary* to that of the rotation of the sun, not sympathetic with it as formerly stated. Hence Saturn originally rotated in an opposite direction to what he does now. But, in this case, the other planets must also have originally rotated in that direction. Therefore Saturn and the others too, including the earth, must have changed their direction of rotation. How was this change brought about?

For answer we are bidden to look at the gyroscope. When that spins, it also executes

a precessional movement; but, if the spinning be checked, the gyroscope turns a somersault. Thus the spinning of Saturn and of the other planets has been checked, causing them to turn over and invert their poles. What checked their spinning? Tidal friction, says the professor, together with the attraction of the satellite; tidal friction has reduced the moon's rotation to once in a revolution, and is reducing the earth's rotation.

Saturn, then, according to the theory, threw off Phoebe when he was rotating in his original direction, then turned over and threw off his other satellites. (This explanation is, however, complicated by the professor's belief that some of the other satellites also belong to the earlier period; but he gets over this difficulty by saying that they, like their primary, have turned over.)

Finally he states that the planets may all have been inverted at least once, and in some cases twice.

The theory of the *periodic* inversion of the poles of the earth is quite consistent with the teachings of *The Secret Doctrine*, given more than twenty years ago, as students of that work know. It is intimately interwoven with the history of mankind and the other animated denizens of the earth, as also with geological problems.

It is interesting to see that modern science is arriving deviously at a confirmation of the teaching. Theosophy, as so frequently stated, always welcomes facts.

STUDENT

Yellow Caps and Red Caps

A RECENT book on Tibet, in a chapter on the "Red Cap" sect of Lamaism, its nether pole, shows that the devil can quote scripture for the East as well as for the West. True Lamaism teaches that "I," egotism, must be lost sight of if spiritual perfection were to be obtained. Oblivion of self, says the Red Cap doctrine, is to be gained during the periods of the actual gratification of vice; this, therefore, is the path to divinity. *Mutatis mutandis* we have heard this in the West. There are even definite cults of it, imagination being developed to lend its whole powers to the spiritual, mental, and physical destruction of the practitioner.

True Lamaism teaches kindness to animals, to the end that their evolution may be hastened. Let us drink blood, says the Red Cap, for in that way the very essence of the animal is brought into direct contact with the spiritual essence of man.

Ideal states of consciousness, which are blissful, should be striven for. Their attainment may be facilitated by intoxication, says the Red Cap; your spiritual aspiration may begin its work with the first step already taken. We have heard this claim advanced for morphine by those who could not or would not see that a narcotized nervous system is as useless for spiritual work as a bog to plant the foot of a ladder on.

Against all these practices the "Yellow Caps" have for centuries protested as diabolic caricatures of Lamaism.

STUDENT

If We Only Knew It!

A CALIFORNIA daily has this paragraph:

LAS VEGAS, N. M. Oct. 3.—That the world is in grave danger of being destroyed this winter by a collision with Halley's comet, and that this catastrophe was what Jesus Christ had in

mind when He predicted the destruction of the world by fire, is the startling assertion of Rev. Father Charles M. Charroppin, S. J., of St. Louis University, one of the greatest living astronomers, who is visiting here on his way to Flagstaff, Ariz., where he is to spend several months in making special astronomical observations.

"Special astronomical observations" with the world at each moment in danger of total destruction! Surely this is fiddling over burning Rome with a vengeance!

One is reminded of the story of the Nevada miner in the 50's, who, meeting a "tenderfoot" with a little .22 revolver, took it into his own hands and after close inspection of it remarked, "Now if you was to shoot me with that little thing *and I was to find it out*, I guess I'd make it hot for you some way."

If we *were* struck by a comet and should "happen to find it out"—and only the astronomers *could* find it out—it would be but an interesting phenomenon for the astronomical records.

But has the church forgotten her old-time methods of dealing with such heavenly visitants? Or are the methods discarded as thoroughly as pills against earthquakes since the orbits of comets have been ignominiously charted upon paper.

People may safely invest in real estate, for the Earth will not be burnt up—by a comet!

STUDENT

The Inside of a Tool-House

YOU cannot reform human nature by machinery. A certain man, seeing garden tools left lying around, for the damp to rust their blades, and the alteration of sun and dew to split their handles, determined to procure a tool-house. This he did. The result was the inside of that tool-house was the only place where you might be perfectly certain of not encountering any tools. Tools might be leaning against the door outside, but that was the nearest they ever got to the inside.

But perhaps we are doing the people an injustice; for what is the *inside* of a tool-house? If you start from the outside of one wall and keep on walking in a straight line, you will (eventually) arrive at the other side. True, the journey will be 25,000 miles, but mere distance does not affect the principle. Hence anything which is "outside" the tool-house is actually between the walls of the tool-house and therefore inside.

It is true that if you set out from the roof, instead of one of the walls, and keep on in a straight line, you would, according to some authorities, get out into infinite space and never return. Yet there are certain mathematicians who have so improved Euclid and doctored up our notions of space that it is quite legitimate to argue that if you set out in a straight path from the roof, you would eventually come up through the floor. This is what is called the "curvature of space." It is also the x th dimension.

Thus we see that every vessel has two insides, one small and one great; and no outside. And this might be pleaded as an ingenious excuse by the people who leave their tools on the alleged "outside" of the building—we make them a present of the excuse—were it not for the obvious objection that it rains on one side of the door and not on the other.

THE OFFICIAL CASUIST

Some Views on XXth Century Problems

Child Victims

AN investigation into the public school curriculum is under way in France. The authorities want to know whether over-pressure is the cause of the increasing number of suicides among the children.

This phenomenon is not confined to France, nor chiefly exhibited there. In Prussia there are 600 annual suicides among young people under twenty years of age, rather more than one-tenth of them being under fifteen. This leaves nine-tenths for the five years between fifteen and twenty. In Russia the case is worse. The school-going population is much smaller than that of Prussia, but the suicides of those *under sixteen* is given at 490 for the year 1907. For those between sixteen and twenty we have no figures. If those for Prussia are any guide, they must run into the thousands.

Professor Gerhardt, who has written a book on the case in Prussia, enumerates among the causes "pessimism," "materialistic and pessimistic ideas," "unhappy love." He thinks that though the young people read Schopenhauer, Nietzsche and the like, it is not thence that they get the suggestion to suicide.

A Russian paper quoted by the (London) *Westminster Gazette*, discussing the case in that country, gives the story of two children committing suicide from "disillusion with life." A third would have done so but was prevented.

In his bedroom were found much-thumbed volumes of Hartmann, Ibsen, and some native advanced writers. "So this is what led you to the idea?" asked his father. "It may have led *them*," answered the thirteen-year-old boy. "For *me* these writers are somewhat out of date." A case somewhat resembling this occurred at Breslau last winter, where a sixteen-year-old girl student of Nietzsche deprived herself of life because she was convinced that persons of the female sex were barred from all ambitions of attaining the *Ueber-Mensch* stage of greatness.

Along with these ranges the Clermont case in Paris. At that school (for boys) there was a regular suicide club, lot-drawing being the procedure and the result of the drawing being carried out.

It is evident that whatever proportion of the cases is assigned to over-pressure, something else is at work. Over-pressure does not make children read Nietzsche, become consciously "disillusioned with life," or join a suicide club.

What is at the back of the phenomenon is that children are children of their parents and born into the mental atmosphere that their parents have created. It is into the *parents* that the proposed commissions must inquire. Why, since the parents are committing suicide more and more, will not the children be doing the same? If the parents have lost faith in life, a proportion of the children will feel their faithlessness. If the parents blot out the sunlight of their souls, there will be no sun for a proportion of the children. What chance have the souls of the children if the parents are agreeing that there is *no* soul?

The inner life of a child has the sunlight of

Spirit direct upon it, the lens of the child's own mind as yet doing little distortion or interference. A crystal will precipitate pure and clear from a dirty solution. The growing mind-feeling of a child in general will not. *In general*, because the souls — Spirit individualized — of some children *are* strong enough to protect them from the age, to hold back from the gradually crystallizing lens the impurities of the solution constituted by the thoughts of the elders. To that solution we are contributing moment by moment, as we think sensual or criminal thoughts, as we hate, as we decide with materialism that there is no soul and that man is matter, as we think pessimism and tolerantly read the pessimists. Our responsibility for the spiritual welfare of children we have never seen and never shall see begins each day with awakening and presses into every moment. The suicide of the children is the reflection of the thoughts of the elders. We are all of us the parents of all of the children, and the teachers, for good or evil, of all of the children.

Nor will there be any relief from the over-pressure, notwithstanding commissions and laws in any quantity until we have admitted and become ourselves inwardly aware as the first of all facts in life, that soul, eternal Spirit individualized, is the sunlight of mind. Only after such an absolute admission and understanding can we treat mind properly, educate the children properly, and enable them to grow up with the three parts of their nature balanced and co-operative. The present perfunctory "religious instruction" administered in stated doses like sulphur and molasses at the schools, has no sort of relation to this profoundest and sublimest fact of human nature. In darkening religion into piety we have destroyed its splendor. And so mind, unlit, has become for us the all-important essence, and to fill it with facts the all-important duty.

The suicides of the children will continue and will increase until we have learned our own human nature and our individual responsibility for the thought-color of the atmosphere. They will continue whilst we make sensation our life and pleasure our aim. They will continue until we have found the real sunlight of life and habitually think in it and radiate it. They are symptoms of the disease of faithlessness.

STUDENT

Dislocated National Life

THE voice of Mr. James J. Hill is always usefully raised in correction of our tendency to self-congratulation. He persistently gives the other side of the picture. And people are respectfully willing to look at it, though nobody knows what to do.

His text is comparatively simple:

In 1790 only about 3.4 per cent of the American people lived in towns. At the time of the Civil War the percentage had risen to 16. In 1900 more than 31 per cent of our population was urban. The change is portentous; and there is no doubt that the coming census will show it to have proceeded in the last ten years with accelerated speed. . . . In New York State 20,000 farms are for sale.

In Iowa the average wheat crop was 29

million bushels; it sank to 10 and is now about 8. Everywhere population is moving away from the soil, is increasing, though at a diminishing rate; and the productivity of the soil is decreasing. Wages and prices are therefore rising, but so is our standard. The luxury of one day has moved in among the necessities of the next. Yet real poverty is increasing.

The ultimate source, the root, of all wealth is of course the soil. In a certain sense every man who moves from farm to city life passes from the ranks of producer and consumer to that of consumer only. He becomes a more or less direct worker *upon* that which has been produced. His move tends to translate itself into added poverty somewhere, increased prices everywhere. Farm values are among those which go up, and this gives fictitious brightness to the agricultural statistics. And the illusion of prosperity is completed by the fact that the statistics of farm products do not show that though there is of course an *absolute* increase there is a *relative* decrease.

People are misled by the statistics of farm values and products, mounting annually by great leaps, into thinking that this absolute increase implies a relative advance of this industry as compared with others. Exactly the opposite is the case. I refer not merely to the quality and results of our tillage, but to the setting of the human tide away from the cultivated field and towards the factory gate or the city slum. This is something whose consequences for evil are as certain as if the aggregate deposits of all the banks in this country were decreasing by a fixed percentage every ten years, while their loans were increasing by another percentage just as stable.

Mr. Hill did not add this touch to his picture: that as soon as the country dweller transfers himself to the town, certain influences begin to lower his health from the first moment. He is less in the open air; his mental life is no longer balanced by physical; and the atmosphere in many parts of large cities is more or less vitiated. His habits change; he is more in artificial light; and his nervous system begins at once to be more worn down by irritation and stimulation. In addition he may have to betake himself to occupations which are essentially or because of long hours actively noxious.

This phenomenon of translation from country to town expresses a disease of the national mind. It is manifestation of the craving for external mental stimulation, for excitement. It will only find its remedy in realization of the fact that physically man is a part of nature and cannot remove himself from her without a penalty. The body loses health, the mind becomes either deadened or febrile. We are dealing with national life and that which may show itself but slightly in the individual sums up to a great total for the entire nation. A fully balanced human nature demands its daily touch with mother nature, just as it will demand its daily quantum of healthy mental work and its daily communion with that which is higher. Man is tripartite and as he must touch Spiritual Nature for his daily spiritual health, so must he physical nature for his physical health and well-being. STUDENT

RUINS OF "SEWOE" TEMPLES, JAVA

The Ancient Temples of Java

THE Island of Java is usually thought of as one of the East Indies, where rice and coffee are grown. It will be a surprise to many to learn that in Java is some of the most stupendous and wonderful ancient architecture in the world, as there is also in the Ladrões, and Carolines, and in fact all over the archipelago. The most famous of all, the Temple of Borobudur, was described in last week's number of this magazine.

The existence of these ancient ruins, together with that of other ancient structures in other parts of the world, confirms the teachings of Theosophy as regards the past history of the human race; viz., that civilization is much older than archaeologists will concede. The attempts of some archaeologists to account for such evidences by theories which will not conflict with their conventional views of history, or with hypotheses about human evolution, afford us some interesting examples of the art of special pleading; but, needless to say, though separate theories may be devised that will make a show of plausibility for each case, the case of ancient remains as a whole cannot be so disposed of; and the explanations devised to suit different cases are not consistent with each other. It is customary to treat all these temples as Buddhistic, thereby ignoring the fact that *Gautama* the Buddha is regarded as only the latest of a long line of Buddhas who appeared successively at long intervals; but there is no doubt that some of these ruins date from earlier ages. The parts of Asia where they occur are a survival of the ancient continent that once stretched in the ocean to the south; and to these parts the descendants of the ancient civilizations of that continent migrated when the continent sank. STUDENT

The Suicide of the Lemming

THE Norwegian Lemming, a native of the mountains of Scandinavia, and akin to the water-rat, breeds with great rapidity, and the surplus population is compelled to seek new feeding-grounds. Hence from time to time, at intervals of years, it migrates, moving in a vast horde over the country in a march which takes three years. During its progress it eats up every green thing on its way, but is itself the prey of eagles, owls, hawks, foxes, and other carnivora, all of which follow the march with the greatest interest.

But when the lemmings reach the sea something takes place which has always been a puzzle. Descending the cliffs, they plunge headlong into the water and swim as if for some promised Eldorado, with the result that all perish; a few survivors on the march being all that remain to form the nucleus of new colonies.

H. P. Blavatsky, in *The Secret Doctrine* (Vol. II, p. 781) quotes from an article on "The Norwegian Lemming and its Migrations," by Duppa Crotch, M.A., F.L.S., in the *Popular Science Review*, Vol. I, p. 143, with her own comments and italics, as follows:

"Is it probable that land could have existed where now the broad Atlantic rolls? All tradition says so: old Egyptian records speak of Atlantis, as Strabo and others have told us. The Sahara itself is the sand of an ancient sea, and the shells which are found upon its surface prove that no longer ago than the Miocene period, a sea rolled over what is now desert. The voyage of the 'Challenger' has proved the existence of three long ridges in the Atlantic Ocean, one extending for more than three thousand miles, and lateral spurs may, by connecting these ridges, account for the marvelous similarity of the fauna of the Atlantic islands. . . . The submerged continent of LEMURIA, in what is now the Indian Ocean, is considered to afford an explanation of many difficulties in the distribution of organic

life, and, I think, the existence of a MIOCENE ATLANTIS will be found to have a *strong elucidative bearing on subjects of greater interest* [Truly so!] than the migration of the lemming. At all events, if it can be shown that land existed in former ages where the North Atlantic now rolls, not only is a motive found for these apparently suicidal migrations, but also a strong collateral proof that what we call instincts are but the blind and sometimes even prejudicial inheritance of previously acquired experiences."

At certain periods, we learn, multitudes of these animals swim to sea and perish. Coming as they do, from all parts of Norway, the powerful instinct which survives throughout ages as an inheritance from their progenitors impels them to seek a continent, once existing but now submerged beneath the ocean, and to court a watery grave. T.

Pre-Cambrian Strata

THERE is no geological proof that the earth was hotter in the earliest times than at present; so that the common form of the nebular hypothesis receives no support from geology.

This is from an abstract of a British Association address by Professor A. P. Coleman. He was talking about the Pre-Cambrian rocks of Canada. Except for the lack of fossils and the great metamorphism, they scarcely differ from later formations. They include great thicknesses of conglomerate, arkose, quartzite, and slate, evidently laid down by water; and the lower Huronian basal conglomerate has all the features of boulder-clay. The extensive development of limestone and carbonaceous shale suggests life. The eruptive rocks found with the Keewatin and Huronian sediments are mainly of surface volcanic origin, lava streams, and ash rocks.

Theories about the age of the earth are extremely various and conflicting, as any student may see by comparing them. The recent introduction of radium as a new factor in the problem is another blow to the common form of the nebular hypothesis. H.

✻ The Trend of Twentieth Century Science ✻

Mental Compartments

BIOLOGISTS who hold the Christian creed in its ordinary forms often keep their religion entirely separate from their science. On one side of the partition they are materialists; evolution is a mechanically determined set of phenomena; casual variation in every direction, pruned by natural selection, accounts for everything. On the other side they are teleologists; evolution is guided by an all-wise divine Providence.

Whether Professor Starling, who delivered the address on physiology to the British Association, is one of these, we do not know. But speaking of the adaptation of organisms to their surroundings he says that

not only does it (the law of adaptation) involve the teleological conception that every normal activity must be for the good of the organism, but . . . etc.

The teleological conception, put fully, is that every normal activity of an organism is *designedly prompted* for its good; that is, adaptation is designedly prompted; and since adaptation is the method of evolution, evolution is the work of intelligent design.

But he then goes on to imagine that during the chaotic chemical changes which accompanied the cooling down of the molten surface of the earth, some compound was formed. . . .

exhibiting some of the properties of life. Of "many such compounds which might have come into being," natural selection finally preserved one whose activities corresponded to the definition of *living*. This having come into being,

the great principle of natural selection or survival of the fittest would *suffice to account for* the evolution of the ever-increasing complexity of living beings which has occurred in the later history of this globe.

So on this side of the partition we have mechanism. The reactions of an animal (including, of course, those germ changes which result in the appearance of variations among its offspring) are "inexorably fixed by the structure of the nervous system inherited by the animal from its precursors." Where is there room in all this for the teleological conception?

The professor faces the consequences:

I have spoken as if every act of the animal were determined by the complex interaction of nervous processes whose paths through the higher parts of the brain had been laid down by previous experiences. . . . The average conduct of the individual, determined in this way, became by repetition automatic. . . . As MacDougal has pointed out, the representation in consciousness of automatic tendencies are the emotions.

As he applies his whole set of principles to man as well, it follows that we are automata, not only in our acts but in our feelings.

The average man, who reads the science articles in the monthlies, keeps the same partition. The essence of what we have quoted will presently get into a popular article. The average man will read it with that sort of half-awed curiosity which scientific deliverances evoke. On one side of his partition he will believe it.

But on the other side he knows that his emotions are *not* necessitated. He can create

an emotion at will; he can, with or without a little practice, abolish any one of them at will. He can alter the whole trend of his desires. He knows that change in consciousness, effected by will, may precede and cause, instead of following, nerve changes. An absolutely subjective thought of a lemon, for instance, called up by will, can set going all those changes in nerves and salivary glands which eating a real lemon would cause. He can create hunger, or get rid of it; he can abolish the feeling of repulsion against some other man and substitute compassion or friendliness. He can do what he will with his character. He can stand back and watch the whole business of thought and feeling *going on automatically* as the professor says; and then *he* who is no automaton can step in at any moment and alter this whole business as he chooses. He knows, in fact, that the professor, in describing the evolution of "man" has left *him* and every other *him*, out of account. Proposing to describe the owner of a machine he has but described the machine and its manufacture—omitting, even there, however, the real manufacturer, conscious and intelligent *nature*, (not *God* in the proper use of that word).

For variations, as zoology is beginning to see, are not fortuitous and in every direction, but *aimed*. That they may fail, or fail to appear, is due to the fact that nature-intelligence is neither omniscient nor omnipotent.

STUDENT

The Veil of Fear

THIS story, told by a correspondent of the *Scientific American*—apparently an oculist—has a moral, though the contributor tells it as science only. He reminds us that about a dozen years ago a certain New York millionaire, being blind, offered one of his millions to anyone who would restore his sight. He was overwhelmed with proposals for treatment, but being a very busy man, found that he would have no time to submit to any of them. So he selected a poor man, blind in exactly the same way—from atrophy of the optic nerve—as his willing substitute in one of the proposed treatments.

This man Martin had been blind nine years. But he was accustomed to take his own way alone about the crowded New York streets. Says the contributor, Mr. Felts, who was conducting the treatment:

Once I left my residence on 22nd Street near Eighth Avenue with Martin for a walk through the city to Third Avenue and thence down town. In passing he would name with great accuracy the streets and notable buildings. His eyes showed no indication of blindness and no one suspected that he was blind. I was amazed to see him cross Broadway at 14th Street with perfect ease, and imagine my astonishment when he shied around some timbers that had been set up across a sidewalk to prop the wall of a building undergoing repairs. He got on and off street cars without a blunder and made his way across crowded streets without betraying his blindness. He used no cane nor did he feel his way with his hands.

Mr. Felts asked him what his secret was and he said he did not know. But he added that since the calamity of blindness had befallen him he had no longer any care for or

interest in his life and would rather be dead. Mr. Felts credits the "subconscious mind" with the power the man used. But the point is that this thing was able to make its deliverances felt because the man's surface consciousness was *absolutely unperturbed by fear*, whether of striking against something, of falling into pits, or of being knocked down or even killed. Doubtless we all have the same power but are unable to note its functioning.

For a similar though wider reason the "superconscious mind" is unable to guide us in the *inner* ways of life. Consciousness is perturbed with the grosser activities of thought and feeling, with the pulses of the egotism of personality; and it fears; fears death, disease, ill-fortune, loss of popularity, of comfort; fears ridicule and dislike. If we could get the selfish personality out of the way there is little we could not know, nothing we could not do that we ought to do. In a fine passage H. P. Blavatsky says:

If man by suppressing, if not destroying, his selfishness and personality, only succeeds in knowing himself as he is behind the veil of physical *Mâyâ* (illusion), he will soon stand beyond all pain, all misery, and beyond all the wear and tear of change, which is the chief originator of pain. Such a man will be physically of matter, he will move surrounded by matter, and yet he will live beyond and outside it. His body will be subject to change, but he himself will be entirely without it, and will experience everlasting life even in bodies of short duration. All this may be achieved by the development of unselfish universal love of Humanity, and the suppression of personality, or *selfishness*, which is the cause of all sin, and consequently of all human sorrow.

The Eternal Flux

ALL is in perpetual flux, said the ancient philosophers; the thing upon which our eyes rest for a single moment, has during that moment changed itself; it is only in our imperfect sight that things are still and fixed.

To this also, as to other ancient views, has modern science come back. The fundamental units of matter, corpuscles—whereof atoms are compounded, and of them molecules, and of them all things visible—are knots in the limitless warp and woof of the ether. The earth, an aggregate of such knots, passes through space. But it is the knots of the strings, not the strings, that pass. The strings are but twisted up in their continuity as the knots pass, and then return to their straightness. All is in perpetual flux, say the modern scientists; the thing upon which our eyes rest for a single moment, has during that moment changed itself.

How came these ancient philosophers to have arrived at a conclusion which every dictum of the senses contradicts? According to current theory their minds were more childish than ours, more sense-tied. They should have arrived at the conclusion that change in the constitution of matter is rather a rare and exceptional phenomenon. The trees and children grow; leaves and men die. But the mountains and the earth on which they rest remain, apparently eternal. Yet the ancients saw the universal flux.

The Nightingale and Geology

A WRITER in *Knowledge and Scientific News* (London) comments on the curiously restricted area of distribution of the nightingale in the British Isles. In many parts of England it is never heard at all, and it is unknown in Scotland and Ireland. In Wales, with one or two trifling exceptions, it is never heard, nor is it found in Cornwall. Northwards it extends only a few miles beyond York; yet it is heard at Copenhagen in about the latitude of Edinburgh. If we draw a line on the map of England from the mouth of the Tees, by Nottingham and Cheltenham, to the mouth of the Exe, we have roughly defined the range of the nightingale. On the right is the region where it is heard; on the left it is unknown.

Now if we draw the same line on a geological map we note that it cuts off on the right an area of younger rocks, from the Trias to the Tertiary, and on the left the older strata, from the Permian to the Cambrian. So it has been suggested that the distribution of the nightingale depends on the distribution of the strata; and cases in which the distribution of a bird is thus restricted are not unknown. The stone curlew is practically confined to the Chalk. It is surmised that the nature of the rocks influences the nature of the vegetation and so of the insects which are the nightingale's favorite food. But is not this a point that could be tested by reference to the actual facts as to vegetation and insects?

In France the bird is unknown in Brittany, geologically similar to Cornwall; nor does it occur in the Channel Islands. Cowbridge in Wales, where it occurs, is on a patch of Lias, and this confirms the theory; but the other place in Wales where it occurs, at Tintern, is on Old Red Sandstone, which contradicts the theory. During the present season the nightingale is reported as occurring at Audley in Cheshire, west of the line on the map; but a glance at the geological map shows that here the New Red Sandstone of Yorkshire and Nottingham spreads out westwards, while close to Audley is a patch of Lias. There are not sufficient data about its distribution on the Continent to test the theory completely; but the writer thinks that such data as there are confirm it; and he gives particulars. Attempts which have been made to induce the nightingale to stay in new localities have resulted in the young birds migrating and failing to return.

It is a sufficiently familiar item of general, if not of scientific, knowledge, that different places have different influences, quite strongly marked off, and perhaps separated by a river, a mountain ridge, or even a political boundary.

"DE BORGER-BEUK"

One of the largest beeches in Holland, and a well-known tree

THE GOLDEN MEAN

FULL oft the darkest day may be
Of morrows bright the sire.
His bow not everlastingly
Apollo bends in ire.
At times the silent Muses he
Wakes with his dulcet lyre.

When life's straits roar and hem thee soar,
Be bold; naught else avails.
But when thy canvas swells before
Too proudly prospering gales,
For once be wise with coward's lore,
And timely reef thy sails.

—William Watson (after Horace Odes II, 10)

This peculiar local influence is accompanied by, rather than caused by, differences of climate; and differences of temperament in the inhabitants, and different "atmospheres" are other concomitants of this mysterious *genius loci*. What relation has the *genius loci* to the nature of the rocks? The mysterious Brother who figures in Charles Kingsley's Novel, *Yeast* says: "the rocks in this country are worn out with ages of contortion; I will take you to a land where the rocks are new and still teeming with fire"—or words to that effect.

It seems natural to think that animal life

may feel and obey the influence of the *genius loci*, respecting which influence there is surely a great deal yet to be learned. Science, following its bent, will seek for the physical expressions of the differences between localities, such as climate, soil, vegetable life; it may now go a step further and call in the aid of radioactivity. But there are subtler influences yet, such as do not present themselves to the eye of physical science. The ancients, realizing that there can be no manifestation of force or quality that is not ultimately the attribute of some *being*, peopled nature with gods, genii, or spirits; which we have turned into superstition. But while the ignorant, even among the ancients themselves, may have made this belief a superstition, it probably originated as a genuine science among the wise, who perhaps knew more than we yet do about the *intelligent* potencies in Nature, as well as the means by which such *presences* might be approached and conciliated by man. If man more generally recognized the existence of intelligent powers in Nature, he might acquire the means of better adapting himself to Nature, thus avoiding many of those quarrels and misunderstandings which now lead to so much destruction and bloodshed among Nature's subjects. But alas! a danger presents itself to the mind. If a modern inquirer should chance to surprise a Nature-spirit in her haunts, would he not

straightway proceed to get an automatic message from it and dub it his dear dead aunt Sarah; or perhaps attempt to regard it as an object of his unregulated "affections"; or imagine that he had a visit from the "Virgin"? Ah! no wonder Nature wears a veil; yet there are certain natures for whom she will lift it. Μακάριοι οἱ καθαροὶ τῇ καρδίᾳ, ὅτι αὐτοὶ τὸν Θεὸν ὁρῶνται.

A Simple Remedy for Scale

AMONG the means adopted to clear the scale from citrus orchards is one which is said to have successfully cleared a badly infected plantation in Montserrat, the West Indian Island "where the limes come from."

Four or five Bengal beans (*Mucuna pruriens*) are planted round each tree during the first rains. These completely cover the trees with their vines. When the beans are ripe the stems are cut and the vines left on the trees.

The *Mucuna pruriens* is characterized by stinging hairs, and is prescribed as a remedy for intestinal worms, which it is supposed to sting to death. Whether or not its action on the scale is the same is not stated.

It would be interesting to know if such a remedy could be used in California. A.

Students'

Path

Theosophy in the Welsh Legends---I

YOU can come at truth in either of two ways: by a road of thought, when the record of your truth will be in the form of what we call philosophy; or by a road of imagination and feeling, when its record will be what we call poetry, in the highest and most inclusive meaning of that term. For the most part the ancient races, when they were aglow with life and vigor, and found the world teeming with noble deeds for them to do, wrote down their ancestral Theosophy in this imaginative form rather than in terms of thought and philosophical statements of law. They had very good reason for doing this. Poetry publishes the eternal verities in the language of action; and proclaims the highest wisdom as if it were not merely thought about, but actually seen; and for that reason it takes hold of a deeper sense and memory than do philosophy or ethics, as such. Of course they had these latter too; but they, and especially the philosophy, were taught mainly in the schools of the bards and priests. In Welsh literature, for example, there is a splendid record of philosophy; but whereas the existence of this is still practically known of only by a few scholars, all the world has heard of the Arthurian legend. A story will float down the currents of time where the barks of philosophical treatise would be apt to founder.

For it is on imagination that we mold our lives, not on reason; let a man quicken and purify the first, and he may be sure that the second will follow. A story, too, is about the most enduring thing in the world; in all likelihood we tell our children tales now that are older than Stonehenge or the Pyramids. A philosophic truth is liable to be distorted by the fears and desires of those who are in charge of it, until all the original marrow has gone. Even if written down the glosses of commentators will so obscure its meaning that at last what is believed will have no resemblance to truth at all.

Think of the teachings of Jesus, for instance: "Ye are Gods," says the Teacher. "Ye are not Gods, but worms and miserable sinners," is the interpretation. "Be ye perfect," says the Teacher. "Which means, that being originally sinful, ye are inherently and forever imperfect," say the interpreters. "Whatsoever a man soweth, that also shall he reap," says the Teacher. "That painful necessity was done away with when the Son of God died for men," say the interpreters. "Whosoever shall do the will of the Father he shall know of the doctrine," said Jesus. "You must believe in the doctrine to be saved," say the interpreters; "and only from the church or the book can you learn what that doctrine is." "The kingdom of heaven is within you," said Jesus. "The kingdom of heaven is far away and beyond the skies," replies the church. And so on, and so on. You see what ethics and philosophy can be brought to in the short space of nineteen hundred years.

But a story is protected by its very unpretentiousness. It makes no claim to save people from the consequences of their sins, and so is no power-getting instrument for the priests. The old stories of the Celts and Scandinavians echoed the native aspirations of the people; and were treasured, even when they had lost their religious significance, because the incidents in them were so fine; because they recorded the noble deeds of the heroes, and infected their hearers with a noble and manly spirit.

They would be perennially in demand, and while many would keep them merely for delight and entertainment, the thoughtful would tend to look more deeply into them; and, by meditation, find in them a revelation of the mysteries of life.

You may forget all the words of a story; but if it be one of these genuine old myths, there is a certain backbone and natural articulation about it which stays in your mind. Every teller would have told it a little differently, each supplying his own words and descriptions of scenery and so on; but the backbone would have remained the same. Even if whole new incidents were added, as they were to the Welsh stories by the Norman trouvères who carried them about Europe in later times, it would remain not difficult to discover the ancient, grandiose, heroic framework among these intricate and personal additions. Now in a good modern novel it is not this backbone that we consider; and very rightly, for as a rule it is not there. The novel tells us about the outside of life; what kind of things people do, how they talk to each other and conduct business and give way to or resist their passions and so forth; even, in proportion to the intuition and observing power of its author, it records the consequences of action, and may teach us great lessons in that way. But the ancient stories made for another goal, symbolizing the grand facts of the inner life; a pageantry and magnificence of the soul at war with sense. They spoke less of external happenings than of interior and eternal truth.

Take for example, the story of that world-renowned old Welsh hero, King Arthur. It traveled so far, and was repeated by so many alien tongues, that it must come as a surprise to most of us to hear Arthur spoken of as a Welsh hero at all; and so far as I know, the only statue erected of him is no nearer his home than Austria. What is it we remember of Arthur? The rubbish about Sir Kay and the kitchen Knave? The love stories of this, that, and the other of his knights? The petty meanings that are set down in Malory and a whole host of modern-spirited story-tellers down to Tennyson and Mark Twain? Not at all. What we remember is such things as these: that there was something mysterious about his birth; that he had a marvelous, invincible sword,

Wrought by the lonely maiden of the lake;
Nine years she wrought it, sitting in the deeps,
Upon the hidden bases of the hills:

how,

One summer noon, in those old days, an arm
Rose up from out the bosom of the lake,
Clothed in white samite, mystic, wonderful,
Holding a sword,

and how he rowed across and took it, and wore it like a king. How he gathered about him a splendid company of knights, the Table Round; and how one of these was evil and betrayed him, bringing to pass Camlan, that "last dim battle in the west," in which he slew the traitor indeed, but was himself "deeply smitten through the helm"; how the dark barge came, with the company of dark-robed queens, to bear him away to Avallon, the Island of Apple-trees, whence in his own time he should return to reign over and save his people.

Now this framework of a story is far more ancient than the sixth century; its origin is lost in extreme antiquity. It was told and retold long before Caesar landed in Britain; and when the first Celtic immigrants came into that island and mingled with its ancient inhabitants, I am inclined to think that they heard from these latter then the story of their antique god-hero Arthur, whose harp was even then set in the heavens as the constellation of the Great Bear, and about his sword Caledfwlch, Hard Gap, whose edge could wound the wind, and whose brightness and refinement were such that the blade of it was more invisible than the air, and lay like a gap of intense bright hardness along the invisible air itself, whence its name. And they heard of the company of lesser gods and heroes that was clustered round him; of Camlan, the battle that

never is over; of Medrawd and Afallen. Why should all this have persisted all down the ages? Because it is eternally true in its deeper meaning; because it is a drama acted out sooner or later, in the life of every human soul.

First of all, let us look into the parentage of Arthur. In the familiar stories, which have come to us through so many story-tellers that had no knowledge whatever of the meaning of the old Celtic traditions they were borrowing from, we read that Arthur was the son of Uther Pendragon, a king of the Britons. Now this name is one of peculiar interest. Uthr Ben Ddraig, or Uthr Ben Ddragon is the Welsh version of it; and when one has put it back into this its original form, its meaning becomes clearly legible to anyone with a knowledge of the Welsh language. *Uthr* is not a name at all, but an adjective meaning *wonderful*; *ben* or *pen* means *head*; and *draig* or *dragon* means either what it appears to mean, or, a leader and teacher; the two things having the same significance in the symbolism of all nations, as anyone can find with a little study; and in the Welsh language, as one can find by reference to the nearest Welsh dictionary. So Uther Pendragon is not a name at all, but a title meaning *The Wonderful Head, the Leader and Teacher*. Now who was this Wonderful Head?

As I said before; in dealing with these stories we have to take care to separate the backbone, which contains the Theosophy, from the unessential details added later by men who knew nothing whatever about Theosophy; for which separation no qualification is really needed but a good knowledge and feeling of literary fitness. You see, anyone could tell the story, and add as much or as little as he pleased to it; but he would have to use the old backbone; he could take nothing away from that, or his story was spoiled. So here we have to take the framework of the story of the Wonderful Head out of its setting in the Mabinogi of Branwen the daughter of Llyr, and set aside what is unessential and does not bear the marks of the same high literary genius.

Now this story, as found in the Mabinogion, is three parts of it backboneless; so we may safely put these three parts down as being the work of some later hand, who, without understanding, attempted to explain and lead up to what was to come—although it must be owned there are some fine things in them too. The part that concerns us, the last part, is as follows.

The seven chief warriors of the Island of the Mighty were in a ship on the sea, and sailing towards Britain, and with them was the Wonderful Head. And the Wonderful Head was living, and talked with them daily and sang with them, and foretold to them the fates and destinies of the Island of the Mighty until the Day of Doom.

There was no body to the Wonderful Head; and there is a bone missing, so to say, in the articulation of the story just here; the reason why the Head was bodiless belongs to the earlier part of the story, and like the rest of that part, is unsatisfactory; and we are not told just what depended upon the fulfilling exactly by the Seven of the conditions their Leader imposed upon them. But the bone is easy to supply, and I shall just slip it into its place in telling the story, with the simple excuse that nothing else will make the whole narrative intelligible.

He was to be with them thus bodiless until they came to London; and if they had obeyed him absolutely until that time, the Island of the Mighty (that is Britain) should be saved, and—and this is the missing bone—the Wonderful Head should acquire a body and wear the high crown of London, which conferred kingship over the whole island, as he had worn it in the ancient times. But if they failed to obey him in any particular, the life would go from him, and all would be waste and mourning, and ruin and loss and decay.

They came to land at Harlech in Ardudwy, and found a feast prepared for them in the great hall at Harlech, with seven chairs at the table, and a pillar of unhewn crystal for the Wonderful Head. And

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question

How may one know that he is following the right path any more surely in Theosophy than in Christianity? Speaking for many others, and certainly for myself, the difficulty lies in the feeling of uncertainty about life. All I can say is, "I do not know"; and yet, if I were sure that Theosophy is a true guide, I would gladly take it up.

Answer

Theosophy is not a thing you can take up in that way. Why the universe is not hedged round with penalties against opinion — although false doctrine has for so long proclaimed so, that we have difficulty in shaking our minds free. Men can honestly take up but three attitudes towards any teaching: either believing or disbelieving it, or of letting it alone as being beyond the scope of his concern. But to say, *I will believe* this thing or that which you do not believe, is a mere hypnotization of the mind, and there is nothing real in it. You believe what you can not help believing; for the rest, you have merely juggled, and made yourself a dupe with it.

Whoever seeks truth will do well to study Theosophy, and understand the system that it unfolds; then he must accept whatever forces itself upon his convictions; and it is likely that this will be an ever-growing quantity. What his present experience fails to confirm, he may yet find an inner voice urging upon him the acceptance of. Let him listen for that inner voice; and look into himself well, endeavoring to distinguish it from coarser clamorings. But you rather insult it when you say, *I will accept such and such teachings*, without reference to the approbation of the soul.

There is no creed in Theosophy, and no parallel to baptism; you do not jump into it suddenly (though one may appear to do so); there is no hell for unbelievers, and it offers no such inducement as an easy road to heaven. If one is seeking this last, let him look elsewhere. He will not find it, for it does not exist to be found; but at least let him not father such an idea on Theosophy, which scouts it altogether, and is concerned with widely different aspirations.

The need is that men should drop this attitude of finding a religion that will save them all further trouble of thought. We must face the facts of life as they are to be found; and face the mysteries of our own nature, mapping out as much as we may of the undiscovered territory within us. A guide we must have indeed; but until we possess a belief that we may decently call our own, let that be plain right versus wrong, and not dogma or the undigestible opinions of others. Every one has it within him to know what is right; no one need be fool enough or knave enough to coquet with doctrines of the sub-man. Right is action that will benefit humanity, and wrong is action that feeds and pampers self; and this is enough guide for the beliefless, provided there be no mystification or jesuitical argument.

To test any theory, you must put it into practice; and unless the mind be numbed with easy dogmas of self-salvation, one's religion grows with the growing nobility of his character. For religion may be either of two things: a comfortable bed to loll in until the soul and faculties are atrophied, or a staff for the surmounting of the heights. It may be a set of dogmas imposed upon the mind to quiet it of the motions of inquiry; or it may be the

perceptions and real wisdom of the soul, however limited by the dull medium of brainmind through which the soul gazes.

If we have not the power to perceive truth, then all religions are equally fabulous, and we had better leave them alone; sticking only to plain morality and the service of others, and taking such delight in bettering this world as the artist finds in setting beauty and harmony on his bare canvas. But if it is true that there is something divine in him, by virtue of which he can come to see for himself how the universe is ordered, then that perception will obviously grow as he brings the divine part of him into use; if only his mind is kept alert for the soul's perceptions. So that, whatever the truth of things may be or not be, the path for a man to follow is the same: he must battle against self and do his utmost for the sake of the world and to unite his consciousness with that of humanity as a whole. And this is the path of Theosophy.

One might go further, and show how such a course would tend to convince a man of the value and truth of specific Theosophical teaching. One observes life, and desires to help it and further its progress; and so becomes quickly cognizant of deeper forces working in the same direction. Perpetually one is brought into contact with character in the making; and notices with what infinite pains Something is at work to evolve fortitude, resistance and compassion in men. One does not look to *see* all men treated according to their deserts; that happens, but on a larger field than our vision immediately covers; but what one does see is, all men treated according to their capacities. There will be the nurseries and kindergartens of the Law, and its unrelaxing universities and places of military discipline; and all classes of souls will be in these or the many grades between them, receiving their opportunities to learn, and punishment for rejecting such opportunities. The point to insist on is this — that there is that which is giving one and all of us a certain treatment and schooling; and that its end in so doing is our growth, is not hard to discover.

Then he will begin to see traces of the hand of justice over it all. Indeed, he will posit justice necessarily, for he feels it within himself and grows in the capability to use it; and if it is within him, then it is within the universe also; for he is a part of the universe, and the part is not greater than the whole. We judge the universe by ourselves, and only believe in injustice when we are ourselves unjust. The just man will at least do it the compliment to believe that it is as honorable as he is himself.

A just and reasonable law then, and the object of its action upon us, that we should learn; that we should not stagnate but go forward. Here is a pretty firm piece of religion for a man to have; a sound staff for him, trust in such a law; the rough places of life shall none of them prove insurmountable with it.

Then, battling against his lower nature day by day, he cannot escape finding out that he is not himself that lower nature; he cannot escape finding that there is something in him divine; and above the brain; and eternal — and presently that that something is himself. And he will put together this idea of eternity and that one of the just and equitable ruling of things; and it is hard to conceive what he will make of them, unless it be Karma and Reincarnation.

STUDENT

in a little while they looked forth and saw what seemed to be three moons rising up over Ireland, and swaying and gleaming in the sky, and pouring forth over the ocean a dream and wonder and miracle of music; and those three moons were the Birds of Rhianon that were singing to them. "We will bide here and hearken to them," said the Wonderful Head; "for the first part of all teaching and instruction is through music and vocal song." And they were in Harlech for eight years, and the birds singing to them.

Then they put forth in their ship and came to Gwalas in Penfro. "And there is a hall in Gwalas where you shall be with me," said the Wonderful Head; "and I shall be giving you your teaching there. And three doors are in that hall. The first looks westward towards Ireland; and through that will be our going in. And the second looks eastward towards Wales; and through that in time will be our going out; those two are open. But the third looks southward toward Aberhenfelen and Cornwall, and from the time the sea and the sky and that ancient palace were made it has been shut. And we shall abide there in peace until one of you opens it."

And they came to land, and anchored their ship firmly, and came up into the hall. And they passed through lofty and splendid corridors, with the armor of giants hung on the walls; and there was no sight nor sound nor rumor of living things where they passed. And they came into a great hall where there was a table, and a feast for seven men spread at it; and a pillar of polished diamond for the Wonderful Head. And there were three doors in that hall. One looked out westward towards Ireland, and through that had been their coming in. And one looked eastwards towards Wales, and through that, they said, would be their going out; and those two were open. But the third door looked southward over the sea towards Aberhenfelen and Cornwall, and it was apparent to all of them from the moment they saw it, that from the time the sea and the sky and that old palace were made, it had been shut as firmly as it was then.

No need to finish the story in detail. The door was opened by one of them, after eighty years. "Evil fall upon my beard," said Heilyn the son of Gwyn (he was the most impatient of all warriors and horsemen), "unless I go forth quickly now." He strode towards the door that was nearest him, and flung it wide; and a groan rang through the palace of Gwalas, and the fair armor on the walls fell clanging on the flag-stones of the floor; ruin seized upon the ancient stones in their places, and the brightness of life departed from the Wonderful Head; "for indeed," says the story, "the door he opened was none other than the door that looked southward towards Aberhenfelen and Cornwall; and it had never been opened until then, from the time the sea and the sky and that ancient palace place were made."

Arthur, then, was the son of the Wonderful Head; and born like Athene, who flashed forth armed from the brain of Zeus. You must note that the father fails to come into incarnation; he arrives no nearer to his capital of London than Gwalas in Penfro, which is a little island off the southwest coast of Wales; whereas the son, Arthur, duly lives embodied and is crowned. One cannot explain the full depth of the teaching conveyed in this story in a short paper like this; but I must ask you to remember the teachings of Theosophy as to the planes of the universe; how man lives, so to say, in at least three worlds; the physical world, the intellectual-passional world, and the world of his divine soul. If we compare this story for a moment with the Hebrew secret teachings of the Kabbalah, we shall get a clue to the meaning of the Wonderful Head; for we find there that the Eternal Spirit is spoken of as Macroprosopos, the Great Face; a bodiless head like the Uthr Ben in our story; and remember that this ancient science of symbolism is universal; we find exactly the same symbols, with the same meanings, in all lands from China to Peru.

KENNETH MORRIS

THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l O f f i c e P o i n t L o m a C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

Religion Day by Day

Vatican Biblical Commission

THE Biblical Commission of the Vatican, which began its work before the accession of the present Pope, in response to a world-wide call from Romanists for an authoritative statement of the official attitude of that Church towards the Higher Criticism, has now issued its decisions. These are couched in a form that is a master-stroke in the art of being non-committal. They are in question and answer, the questions being so long and involved that each really constitutes a host of questions; yet the answer to each is merely yes or no. One will suffice for a sample:

To the question as to whether the first three chapters of *Genesis* contain, not accounts of things that have really happened, but either fables derived from the mythologies and cosmogonies of ancient peoples and by the sacred author expurgated of all error of Polytheism and adapted to Monotheistic doctrines; or allegories and symbols destitute of any objective reality and proposed under the form of history to inculcate historical and philosophical truths; or legends partly historical and partly fictitious, freely composed for the instruction and edification of mind—the answer is in the negative.

This leaves ample room for various interpretations to suit circumstances. One hopes the Romanists will be satisfied and will no longer disagree as to just what the Church does teach.

Balm, Treacle, or Rosin?

It is familiar to scholars that two versions of the Bible, the "Treacle Bible" of 1568, and the "Rosin Bible," printed at Douai in 1609-10, got their names from using the words "treacle" and "rosin" respectively instead of "balm" in the passage from *Jeremiah* viii, 22, "Is there no balm in Gilead?"

This surely illustrates the folly of attaching too much value to the English words of this book. Balm, treacle, and rosin are not particularly alike; perhaps balm is no more right than the others. People can hardly maintain that any particular version of their Bible is the really inspired one, especially when we consider the translations into foreign tongues, some of them Polynesian or Eskimo, where the "lamb" of God becomes a "pig" or a "seal."

Chinese Missions a Failure

WHATEVER you may wish to believe about Christian missions in China, you can find statements to support your belief. Chinese missions are either an absolute failure, or a great

MEMBERSHIP

In the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

success; each must decide for himself which.

The *Los Angeles Sunday Times* prints a long statement on this question by a returned missionary of twelve years' experience. He says the churches are wasting their money; the religion of China is Confucianism among the educated and atheism among the uneducated; the new schools will revive Confucianism and make it the established religion. The Chinese use the missions as a means of advancing their own personal interests, and the missionary sees too late that his success has been only imaginary. They return to their old belief after the mission has ceased to give them any personal advantage. For nine years the missionary worked chiefly on educational lines; and out of the 600 or 700 students not one remained a Christian, but as soon as there was an opportunity to go into government service they became Confucianists.

As to medical missions, not only do the Chinese believe in their own medicines, but so do we, since we have Chinese physicians in America.

As for the civilizing influence, he says that it degrades a man to take him from his high culture in his own civilization and make him a half-civilized American-Chinese; and that civilizing missions are neither civilizers nor missions and should not be supported.

The Chinese judge the religion by the people, identifying the words Christian and white man, and point to drunkenness and other vices. Missions are kept up by foreign money, and the results disappear when the money does. He found no true Chinese Christians, and thinks that if protection, education, and money were withdrawn, the situation would be cleared and people would see how little Christianity there is.

With the above may be compared some quotations given in the *Literary Digest* under the head of "China's Antichristian Campaign." The Year-Book of the Berlin Missionary Society is quoted as saying:

The sentiment of the Government is distinctly hostile to Christianity. The Wai-Wu-pu or Board

of Foreign affairs at Peking has issued a decree forbidding any Chinese to found an independent church or to collect any funds for the Church. A general desire seems to prevail that the extension of Christianity in China should be checked.

And the *Kreuz Zeitung* says:

General opinion in China is hostile to Christianity. . . . The teaching of Confucius forms the national religion, and it is on the basis of this

that China desires to institute political, commercial, and intellectual reforms, in short to modernize its people. "China for the Chinese," that is the goal toward which the efforts of the reformers are directed. These reformers are therefore not inclined to favor Christianity. . . . The reformers are very willing to learn from the whites and the Christians, but they would like to employ the learning so acquired in the service of the national religious sentiment, and, as far as possible, in opposition to the Caucasian world. They wish to avert the possibility that Western civilization should supplant Chinese civilization, and Christianity take the place of Confucianism. They look forward to the day when China shall be completely free from European power and every other foreign influence.

The Triune Immersionists

THE papers describe how a sect called the Latter Reign of the Apostolic Church or the Triune Immersionists, in Massachusetts, gathered in their chapel on Sept. 23 to await the end of the world, and how they took heavy clouds and rain as forewarning signs of its advent. After staying all night and singing, they decided that the Advent had been postponed for twenty-four hours, and met again next day, at which stage the account leaves them. Many are said to have disposed of their worldly goods.

There are still many people at large who need educating. But it is a queer world! These particular fanatics are harmless compared with many who pass as well-educated people, yet whose actions are injuring society.

Lack of Candidates for the Ministry

THERE is a most serious lack of candidates for the ministry, both in America and in Europe, and church authorities are gravely discussing the situation without being able to agree upon an explanation.

Is it not because of a lack of conviction? If a man has not conviction, then he must be a hypocrite; and even if he is willing to be that, there is not so much money in it as there is in business. An intending candidate must hire himself out to teach certain stated doctrines and must pretend to a superiority which he knows he does not possess. Surely there is explanation enough here. RELIGIOUS STUDENT

THE THEOSOPHICAL ADDRESS AT ISIS THEATER

A LARGE audience attended the meeting at Isis theater last night and listened with great interest to the very attractive program given by pupils of the Râja Yoga Academy at Point Loma.

Those who have once heard the Râja Yoga orchestra and the other musical work of these young students know well what the character of their playing is, and last night's performance was no exception to the rule.

The young speakers, Miss Hazel Oetli and Master Antonio Castillo, showed great thought and care in the preparation of their papers, showing originality, freedom and depth of thought that one rarely finds in such young students.

From the first paper, "Râja Yoga: The Light of Knowledge," by Miss Hazel Oetli, we quote the following:

"In seeking after knowledge," she said, "we have lost the nobler meaning of the word, and with the loss of its incentive power has gone its light. So often now knowledge is sought only for selfish ends, and those who seek wander along the bypaths instead of walking along the open road.

"What is that incentive power, that indescribable something which will be capable of coping with all situations? Truly it is Râja Yoga, the light of knowledge. . . .

"Râja Yoga may be applied to all branches of life and the education received therein; no situation will arise but may be mastered and strengthened by it; no phase of science, literature, or art, but may learn from it. . . . It teaches man to look into the depths of his own nature, where he will find much to foster and a great deal to overcome. . . .

The other paper, on "Education: What It should Be," was also full of interest, as may be seen from the following brief extracts:

"Nothing marks this age more for its materialism than its system of education. We call this an enlightened age. Rather let us say that this is an age that needs enlightenment. Look at the life led by the majority of us today. Rushing blindly after the material things of life, burdening ourselves with all that hinders our progress. Living, we think, but what an unreal life. It is the body, the desires and passions, the lower mentality actuated by ambition and greed; it is these that usurp the stage of life; only now and then does our real self come on the scene.

"Do we find joy in life? Rather, do we not find merely fleeting pleasure? Are we ignorant or are we indifferent? . . .

"Now let us see what there is in the Râja Yoga system.

"It aims at a balance of the physical, the mental, and the moral nature of the student. The physical side of the training receives the attention it merits, for a healthy body is necessary. But the excessive sporting spirit that is found in some of our colleges is not encouraged. Its evil consequences are great. An undue regard for the physical coarsens the nature.

"The emphasis laid by the Râja Yoga system on good habits as indispensable to health and true happiness places it on a higher level than any other system. The knowledge of himself thus imparted, the self-reliance and self-control thus gained by the Râja Yoga student, are invaluable. The mental training again is such that its results have called forth much surprise and commendation. . . .

"If the problems of our time are to be solved, education must be based on altogether different principles. Higher ideals must be inculcated in the youth of the race. We must develop the higher qualities of the mind and soul. What system of education at present will do this? We only know of one and that is the Râja Yoga system of Katherine Tingley. Her great aim is to upbuild the race through the young. Her system aims to develop the higher nature of the child, to teach him his divinity."—San Diego Union

The Missionary Question

THE following letter, clipped from the *Congregationalist*, is addressed to the secretary of the South African Temperance Alliance:

Dear Sir, I am first writing to tell you that the liquor is a great sin to natives. Why was this liquor brought to this country? Now did you not notice in England that liquor was a sin when people got drunk? Why did you bring it here, then? If you are helping the churches why do you not stop the liquor from coming to this country? Many natives are church people. I say some are much better than some white people. Some white people are the worst people God ever sent to Africa. White men always spend money, money, money. If white men are Christians, we natives will all enter the Kingdom of Heaven. I am one of the Church of England for twenty years, but the liquor is too much for us to bear. Sir, your servant.

The white man among natives, whether he is a missionary or a temperance promoter or any other kind of philanthropist, is like a well-intentioned person afflicted with a highly infectious disease. His good intentions do not save him from being an unwilling agent of destruction wherever he goes. Or we may compare him to a hospitable neighbor who keeps a savage dog which he either will not or cannot constrain. The natives have a perfect right to protest, nor do our assurances of good intention constitute any reply to their protest.

What, after all, is religion? Clearly, for the purpose of the present question, we may distinguish it into two kinds. There is first of all the moral atmosphere which a man carries about with him; that, in one sense, is his religion. Secondly there is his creed and professed faith; and this latter is oftener than not an entirely distinct affair. But, when facts and results are concerned, it is the former kind of religion that counts.

The missionary may wish to dissociate himself from the drink-seller, the unscrupulous trader, or the impure liver that follow him; but as long as he recognizes these as his fellow-countrymen, associates with them, and fails to prevent their coming and their destructive influence, he is an aider and abettor in the evil they work. Common justice accepts that interpretation; the natives accept it; we ourselves would accept it, if any foreign people should under similar circumstances invade our territories.

The honest truth is that our accepted religion is not a religion at all in the true sense. It fails to elevate the character of our race; it fails to control vice and prevent its destructive influence. To take this (so-called) religion to the natives is like importing the cholera along with a few bottles of medicine, and, when the natives object to the cholera, extolling the efficacy of the medicine. They will say, Why do you not cure your disease with your own medicine before coming to us? We had rather be without you altogether.

And the only answer is that, before we presume to introduce this religion to any other people, we should reform it at home and make it effectual for the reformation of our own people. Then we may have a message for the so-called heathen, not before. But moral reforms nowadays are not running on the lines of religion at all; they are coming from outside the churches. They appear under the guise of co-operative efforts for hygiene and sanitation, both physical and moral, a greater

sense of political and social duty, practical philanthropy, greater wisdom in the management of resources, etc. That is the sort of religion we ought to import to natives. If people could go over there and show them the universal example of clean and well-restrained lives, health, common-sense, and real friendliness and justice, a very different result would doubtless be reached.

We cannot blame the native for estimating the foreigner as a whole; even if he should be able and willing to admit the distinction between different grades of foreigner, such as the missionary and the gin-seller, he has to go by actual results, and to him that distinction does not count. The missionary is not representative of his own race. His religion is not a religion, but a mere cult. And what are the objects of the white man as a whole? They are, plainly stated, to acquire land and merchandise, and the control over these and any other available sources of revenue. That is what the white man comes for, when we lay aside all cant; the *results* prove it. "You give me your land, and I give you my Bible."

And the missionary is the thin end of the wedge, as history shows. What wonder that the native should regard the whole thing as a put-up scheme for deluding him with the fairest promises, whereby he is made susceptible and unresisting for our ulterior purposes. And is not this, in fact, what it really amounts to? The missionary may be sincere as an individual; his whole church even may be sincere; yet he is part of a race and therefore a partaker in the doings of that race. The fact is that whatever his own personal motives may be, he does act as the thin edge of a wedge and he does open up a channel for the introduction of drink and commercial spoliation.

Now if a man of good intention finds that, against his will, he is being used as an agent of evil, what ought he to do? If the pious missionary finds that he is in reality but part of a treacherous mechanism for inserting the point of a lever into the foundations of a nation, and that his blessed gospel works out as a poisoned chalice and himself the hand that offers it, what ought he to do? One would think that if he has any sense of justice and self-respect, he ought at once to decline the office; and, realizing that his gospel has been rendered a source of woe, resolve to give up preaching it—at least until he can make it otherwise.

The great lesson to be learned from all this is the lesson of our responsibility for each other, the lesson of solidarity—that solidarity is an actual fact which cannot be blinked. Whatever may be the professions of individuals and classes, the race acts as a unit and everyone is involved in the results it produces. The missionary cannot escape the odium attaching to the evil effects wrought by white men upon natives; nor can he escape the retributive justice. The fact of his solidarity with the rest of his race is brought forcibly home.

In view of all this, does not the work of the missionary lie nearer home?

One sometimes hears people say: "It's the fashion to run down the missionaries, but as a matter of fact (seriously speaking, between you and me) all travelers know what a lot of real good missionaries are doing." But it is not necessary for the present purpose to deny that many missionaries do good; the present

question is, What is the total effect of the white man's gospel; and that can hardly be described as favorable on the whole to the dark man. Any good that may be done here and there is overbalanced by the races wiped out and reduced, and the complaint quoted above is a representative sample. Also it is possible to claim the missionaries who accomplish real good as being shining examples of the better order of things which ought to obtain, and not as representative of missionary effort in general. They are fortunate in choosing fields where the trader and drink-seller do not immediately follow them and destroy their work.

Clearly a man or a society that sets out to elevate a race to a higher level must first of all have a definite and adequate idea as to what is intended to be done; next must be able to enforce precept by example; and finally must be backed up from at home. As to the first point, it is doubtful if any form of Christianity is what is needed; as to the last, national solidarity is essential.

It is to be hoped that soon the question of the treatment of native races will be made the subject of scientific study and be cared for by responsible and effective bodies, in the same way as sanitation, forestry, etc. are now being looked after. Then it will be possible for the white man to act as a unit instead of playing the hypocrite and undoing his own work by his lack of unity.

H. T. E.

The Eskimo and the White Man

THE Eskimo occupy the Arctic coast from Greenland to Alaska, and even beyond, extending into the Aleutian Islands and the extreme north-east of Asia, as far as Kolyuchin Bay. They number, all told, according to Kurl Hassert's estimate made in 1891, about 40,000. . . .

Wherever they occur, the Eskimo are distinguished by a remarkable uniformity in bodily character, habits, implements, language, and mode of life. Yet they have no national unity. . . .

Some fifty dialects have been distinguished in their language, but the most unlike of these, i. e., the dialect spoken on the east coast of Greenland and that on the Asiatic side of Behring Strait, do not differ more than, say, English and German. Thalbitzer, the latest writer on the subject, remarks that the Eskimo language, so far as known, stands apart from all others. . . . Their physical characteristics bear the same testimony, and stamp them as a race apart. . . .

Notwithstanding the hardships of the struggle which the Eskimo wage with reluctant Nature for their existence, they were at one time by no means a miserable race; they made themselves comfortable in a frozen region where other men would have perished, took a healthy enjoyment in life, and were distinguished by many estimable domestic and social qualities. *The intrusion of the white man has brought with it its usual evil blight—poverty, sickness, selfishness, and loss of self-respect.*

The above is quoted from a paper by Professor Sollas in *Science Progress*, and special attention is called to the passage we have italicized. Selfishness and loss of self-respect, poverty and sickness—a pretty good category of evils, yet they are described as the usual evil blight brought by the white man. Really it is an unendurable charge for a white man to be told that his presence usually causes an evil blight among good races, that his atmosphere breathes poison, and his coming betokens decay and death. Yet we brook the charge, for is it not the truth?

But there are extenuations that may be pleaded. We might say that the lowly races are under no moral strain, their life being so simple, their temptations so few; and that we

bring knowledge and opportunity, which they cannot withstand because they are so weak. Perhaps we would be as good as they, if we were in their place; perhaps we would be even better. In one of Tolstoy's stories a fiend destroys a peaceful community by teaching it the art of fermenting.

Of course there is truth in this view; the races we destroy are weak; and their virtues, however excellent, do not save them. But to what extent does that excuse us? The weakness of a neighbor is a challenge to our chivalry, not an invitation to our superior force. And are not strength, knowledge, and virtue, qualities which we claim to possess?

Granted that the endowments of civilization constitute fatal temptations to some races, the question arises, Could we not by our wise care obviate this evil effect and successfully conduct the native over the bridge between wild life and civilization? As it is, we only increase the destructive effect by the selfishness and greed we display. If our civilization in its present state is destructive to natives, perhaps there may be a kind of civilization which is not destructive. At the very worst, and on the extreme assumption (which is not admitted) that such races must disappear, how very much sweeter might their eventide be made! We could at least contrive to make it evident that we were not the abettors of their retributive destiny but had done all in our power to save them.

But, however good may be individuals, civilized peoples as a whole, in their collective capacity, are "on the make" wherever they go. We do not seem to have much *collective* conscience. Considered as a crowd, we are not philanthropic or beneficent. In place of a conscience we have certain proclivities which our wiseacres denominate "economic laws," "survival of the fittest," etc. These laws are hard on the native, though "God" in his "inscrutable wisdom" sees fit to suffer them. How long will it take us to wake up to the cant of this situation? There have been ancient empires—say, the Roman—which did very much the same things as we do, but did not trouble themselves to invent plausible justifications for their acts; their rough sincerity was far more merciful; yet how we do moralize about them!

The fact is that these circumstances in regard to native races bring forcibly home to our minds that our civilization is not so good as we paint it. We feel like pious people convicted of sin and resenting the fact. We cannot believe it possible, and will sooner blame anything, even our "God" himself. But if we seriously desire to remove the stigma, we shall have to eat humble-pie and realize that what we need is a *collective conscience, a unity of action for good, a solidarity of noble purpose (and not alone of material interests)*.

One missionary of exceptional character may benefit a native race, because he is a unit for good; but after him comes his race, which is not a unit for good, but a multitude bent on gain. Until white men have become united in a solidarity for good, they will have to bear the reproach of being a destructive influence.

There is no need, however, to take a pessimistic view. We are improving all the time. Much more public conscience and sense of duty is displayed now than in earlier days. What we realize chiefly now is the need of

wisdom to carry out our good intentions. An American woman in a story visits Arab homes in the north of Africa, dusts out the shelves and spreads pieces of newspaper on them, which the Arab children promptly utilize for paper caps. Tact and adaptiveness is needed. The account quoted from above cites the following from another writer on the Eskimo:

"On approaching these places . . . the visitor, on being told that each of them contains about a hundred natives, and two or three missionary families, will be at a loss to make out where the former have their abodes. The mission lodges are pretty spacious, and for Greenland even stately in appearance. The stranger will probably be surprised on being informed that these buildings are only inhabited by missionaries, because he discovers nothing like human dwellings anywhere else. Then his attention will be called to something resembling dunghills scattered over low rocks and partly overgrown with grass, and he will be surprised to learn that the native population live in these dens." (H. Rink, *Danish Greenland*.) At one time these people had good winter houses.

The treatment of native races surely needs to be made a subject of systematic study and administration, so that it may be in the hands of a power representing the collective wisdom of the white man, instead of being left to free-lance and experimental agencies. But such an administration would have to sift to the bottom all questions of religion, commerce, and politics, and make up its mind definitely whether it intended to benefit the races or to promote the aggressive and acquisitive instincts of the white man.

The upshot of the whole matter is that, in order to live up to our ideals, we must (as a race) acquire incentives higher than those of aggression and acquisitiveness. These will not work; they discredit us. Higher, nobler ideals of the purposes of life, and of the privileges and responsibilities of our humanity, are the only things that will meet the occasion. Hence the importance of such an attitude towards life as that which Theosophy instills. T.

Lost Ten Tribes at the North Pole

ACCORDING to a newspaper dispatch from Salt Lake City, the failure of Cook and Peary to discover at the North Pole the Lost Ten Tribes of Israel, has conflicted with a certain doctrine of the Mormons. They are said to have clung to the theory that the Tribes (?) who left Palestine a few centuries before Christ and traveled in a northerly direction for a year and a half, were at the Pole. They claim to have located them through a series of remarkable revelations, and to have confirmed the theory by references to the books of *Isaiah* and *Jeremiah*. In the day when the Mormons would be afflicted by the opponents of their religion, these older chosen people of the Lord would come down in their millions to the assistance of the Latter-Day Saints.

Probably intelligent Mormons did not believe this story; but those who did believe it can easily add a sequel to the effect that the Ten Tribes have left the Pole and gone somewhere else. Probably the discovery of the Pole has destroyed other theories besides this one. T.

THE celestial Tao does not strive and yet it overcomes everything; it does not speak, yet is skilful in reply; it does not call, yet things come to it readily.

It is quiet in its methods, yet its purposes are duly effective.—*Tao-Te-King*

✻ Art Music Literature and the Drama ✻

Seneca and His Philosophy

SON of a professional rhetorician, brother of two enthusiastic students of oratory, Seneca from boyhood showed a deep interest in philosophy. Two of his instructors, Sotion the Pythagorean and Attalus the Stoic, were especially revered by him; from them he learned the habits of abstinence and self-denial which distinguished him during his career, even when his wealth had become so great that he was a mark for the envy of the bloodthirsty crowd round the Emperor Nero. It is refreshing to picture Seneca, amid all the horrors of wanton luxury and cruel vice that accompanied the corrupt days of the Roman Empire, enjoying the simple pleasure of tending his garden or running races for exercise with a slave boy. It was from his Spanish mother—named Helvia, as was also the Spanish mother of Cicero—that Seneca inherited his love of philosophy, his ardor and imagination. She and her sister, wife of the governor of Egypt, were noble, modest, disinterested women at a time when these qualities were rare among Roman matrons, although not rare among the women of Spain where Seneca was born, (Cordova, 3 B. C.).

Seneca is at his best in his moral writings, which consist of treatises on ethics, and *epistolae morales*, his essays on natural phenomena also having an ethical value. These writings are Stoical sermons of high type, inculcating truth, courage, kindness to slaves, and universal benevolence, in a way which, because of the general ignorance of ancient Oriental philosophy, is often said to have anticipated modern ethical ideas.

No picture of a stern, uncompromising Stoic, would, however, be a true one of Seneca. Besides being a philosopher, he was a wealthy, successful man of affairs, and, when the vicissitudes of Roman life under Claudius drove him into exile in Corsica, two of his letters, the *Consolation to his mother Helvia* and the *Consolation to Polybius*, reveal successively the philosopher and the disappointed man of the world who feels his gifts to be wasting in idleness and exile. These two writings furnish the key to all the compromises of Seneca's later life, when, recalled to Rome and installed as preceptor of Nero, he used his great gifts so to direct the training of the young prince that the horrible traits he possessed were kept in abeyance during five years of rule only to

burst forth later in force and fury no compromise could stem because not one of these hideous faults had been faced and fought.

Seneca may have believed that it was useless to try to turn Nero to the conquest of his passions—heredity and previous training were against him—but it would have been a glorious venture. As it was, Seneca the preceptor, the man of letters, the statesman, enjoyed a position of dazzling pre-eminence and influ-

of Greek originals which at the time of the Renaissance were regarded as models of tragic art. One may inquire why Seneca, and not Aeschylus, Sophocles, and Euripides themselves, furnished the model. The fact is that the Greek tragedies remained unknown except to the few, Latin models being regarded as inspiring and authoritative, the dramas of Seneca and the precepts of Horace being generally followed.

Seneca has been criticised for yielding to a falsely sentimental style in much of his writing, by which the idea often seems to be, if it be not actually, subservient to the rhetorical garment of it. But as a matter of fact he was really less affected by the then fashionable manner of writing than most of his contemporaries, and we are indebted to him for much philosophy that will bear the test.

Seneca was the virtual discoverer to his generation of the fact that humanity is the great theme while conduct is "three-fourths of life," and that topics pertaining to these had a universal interest. His essays on morality, virtue, right conduct, self-improvement, and the laws of true living, may be read with profit today, even though we must take issue with certain of his views, for example, his defense of suicide as a privilege or duty.

Seneca must be said to have had a high ideal, which he was unable to follow. Nothing shows this more clearly than his attitude to death. There is an element of anxiety in his meditations upon the subject, and in his death, commanded by Nero, accomplished by cutting his veins and finally stifling him, though there was Stoical grandeur, there could not be the supreme mastery of the wise man who has never compromised with the enemies of his Soul.

Yet in judging him we must consider the age in which he lived. The man who is float-

ing lazily down stream may easily cover more space and get farther than one who is breasting a mountain torrent or struggling to keep his boat from being swept to destruction in whirling rapids; yet it is the latter who puts forth the real effort and expends the real strength. Seneca lived in Rome's "palmy days of corruption," and as a member of that remarkable group of Spanish-born Romans who shed such undimmed luster upon the Latin "Silver Age of Literature," he deserves acclaim for his love of mankind. STUDENT

SENECA (NAPLES MUSEUM)

ence, and the Romans enjoyed a brief respite, the *quinquennium Neronis*.

It was Seneca who drew up Nero's State papers, at one time even lending his talents (so his enemies said) to a defense of matricide—for Nero, it will be recalled, murdered his own mother, the ambitious and wicked Agrippina—and it is probable that the *Orationes*, now unfortunately lost, included the speeches which Nero delivered as his own.

It is not known at what time of his life Seneca wrote the tragedies, feeble imitations

Do not act from personal motive: that is not the way of Tao—Lao Tsze

In the Strength of the Soul

Thou canst not fail! The future all unknown
Lies in thy power—its secrets are thine own,
There's not a task that thou canst not fulfil
Strong in the thought, as thou thyself shalt will.

Clara B. Beatley

THIS is also the teaching of Theosophy. But they are words addressed to the soul, not to the personality. And they are true only for those who know that they are souls, and who understand from the soul's standpoint, what is failure and what success.

It has but little meaning to one who is not conscious of his immortality, and no real meaning as a promise of fulfilment on this earth to one who does not believe in the teaching of Reincarnation.

It is like the subject of prayer. The real prayer from the heart of one who knows how to pray is a command and must and will be answered. That which is sometimes called by that name, by those who do not recognize their divinity, is a sacrilege, a trifling with sacred things. A request for this or that personal material benefit, which may or may not be in the Law, which perhaps may injure as many as it seemingly favors, has naught to do with the affairs of the soul and has no place in the higher life.

Those who desire any of Nature's gifts, and are ready to work for them, holding the desire from one life to another, will certainly attain to that which they desire—such is the power which lies in man. But if the ambition has been a selfish one, something which it is desired to hold personally, unrelated in the mind to the good of the whole, it will be lost again, just as surely as it can be temporarily gained.

He who knows that he is soul, knows that he is deathless and that he can triumph over every obstacle, great or small. Such know the meaning of life; that every event has its lesson; that life is for the experience of the soul. The full consciousness of this is the

crown of all evolution. Then, surely, is one superior to every event. Every moment comes freighted with its message, which the soul is eager to hear, *and answer*. Ordinary pain and pleasure disappear in the higher pleasure of reading the meaning of the moment and being willing to receive its lesson. The desire to annihilate events as they have been marshalled forth under the working of the Great

From such a one, indeed, nature has no secrets—

She will open wide before thee the portals of her secret chambers, lay bare before thy gaze the treasures hidden in the very depths of her pure virgin bosom. Unsullied by the hand of matter, she shows her treasures only to the eye of Spirit—the eye which never closes, the eye for which there is no veil in all her kingdoms.

Such a soul is victorious, triumphant over death and—*life!* GERTRUDE VAN PELT

THE LITTLE MOUNTAIN BIRD

Welsh Air—Can Adar Man y Myrdd

WHILE the wild birds were singing,
Their wild notes world-wide ringing,
A song I heard with the Little Mountain Bird
That set these wild worlds ringing.

It rang forth from the dawning
Down all the golden morning;
Thorough blue noonday rippled out his tune
All fraught with strange, wild learning.

His voice came stealing, streaming,
From Tybie's white well gleaming;
It fell like sleep round Carreg Cennen keep,
And filled the hills with dreaming;

It drifted snow-wise, slowly,
From Derwydd to Wernoleu:
God fired with song his wild, prophetic tongue,
To drench the whole night wholly.

The apple-bloom at even,
Nor all the white stars seven,
Nor blue night stirred; and the Little Mountain Bird
Spread songs 'twixt Wales and heaven.

Kenneth Morris

Law, or to change their order, is lost in the desire to master what they hold for the soul. Such a one has found himself, and to him it is said:

Then canst thou go through the fight cool and unwearied, standing aside and letting him (the inner Self, the "Warrior," the divine soul) battle for thee. Then it will be impossible for thee to strike one blow amiss.

The Tireless Tongue

THERE are women who might say with Tennyson's brook, "I chatter, chatter as I go," for they are chattering and going somewhere most of the time. They seem to think that life is made up of motion—of the tongue, in talking; of the body, in getting somewhere else; and of the mind, in sorting over inconsequent things. They come to regard quiet and silence with a sort of fear as though some vital process in themselves would stop if they did not keep up the outer activity. Wherever they are, shopping, visiting, at entertainments, traveling, or at home, they keep up the talk, while they say but little. Even when their tongues are stilled in sleep, their minds chatter on in dreams.

Not a few of these women go to the doctor's office in their rounds, complaining of weariness and seeking tonics which are bracing. They usually take a friend along to talk to while they wait, or if alone, they try to secure the patient ear of some other woman in the reception room. Their voluble recital of pet symptoms and other personal matters makes it easy to account for the expenditure of enough energy to exhaust a strong man. Indeed, the average man could not keep pace with them for a single week.

Now, however easy talking may seem, every word consumes a certain amount of force, as the nervous impulse in the brain travels to the tongue and stimulates the whole set of vocal muscles into activity. Furthermore, the mere

chattering over events and details, without logical thought, affords the brain no strengthening exercise and wearies it to no purpose. It is like a machinist aimlessly making some of the wheels of a complex machine spin round instead of starting the whole mechanism into motion to produce a useful result.

When the mind takes in a definite idea, digests and assimilates it, the latent mental power evoked gives the thinker a sense of greater strength and freedom in the liberating gain of a larger view point. But the chatterer "goes on forever," seemingly without arriving at any special conclusions or drawing any logical inferences.

Who has not heard persons with the habit of relating their stock experiences repeatedly, evidently without ever finding in the grouping of characters and events any meaning? Who does not know women who have developed the adolescent sense of exaggeration into a habit of making the most ordinary experiences the bases of dramatic recitals? There is a certain vanity, selfishness and stupidity in assuming that a colored report of merely personal happenings is of value and interest enough to engage the attention of listeners.

"Speech is silver": the friction of alert minds discussing some impersonal subject often helps to make its meaning clear. Nevertheless, "silence is golden." It is in the silence, and there alone, that we have to face the real issues of individual life finally, however long we may

evade them with talk. You may hear the truth a thousand times, but only when it is felt deeply within does it become true *for you*. Spoken words cannot be recalled, and often idle, thoughtless sentences continue to carry meanings which react injuriously upon both speaker and listener.

We may protest that we must have "small talk," and that the amenities of social life bear no relation to logic; but even these occasions may be used to carry cordial and genuine good feeling which sometimes serves a more valuable purpose than intellectualism or civil flattery. The greetings of the chatterer have the chatterer's mind and feeling behind them; but the same civility from a quiet, sincere, well-poised woman may bring to the hearer a larger, better, and surer sense of that divine relationship which makes us all kin.

There is something inexcusably wasteful in continuous chatter; it wastes the time of the talker and of the listener; it wastes energy and nervous endurance; and it wastes mental

power by spoiling the mind for concentrated, logical thinking.

Do not chatter, chatter. Get your ideas dressed and in shape before presenting them to others. It will save an amazing amount of time, talk, and strength, and instead of your listeners being bored they will be glad to have you say something. STUDENT

The Crusade Against the Fly

HOUSEWIVES will be interested to know that the recent crusade against that dangerous pest, the common fly, seems to have been started in America and Europe at practically the same time. American physicians of note have been gathering statistics

mans, upon the baby's eyes and lips, or the housewife's cut or abraded fingers.

Flies have an affinity for filth which is diabolical when its full meaning is considered. And filth—the special and indescribable kind that flies particularly love—is poison most virulent. The ease and grace with which otherwise good housekeepers tolerate these pests is explainable only on the ground of ignorance. Once let it be known that the fly is more deadly than the mosquito in yellow-fever districts, and that where filth is not, the fly will not long remain, there will be a crusade such as will transform our alleys, back-doors, cellars, kitchens, dining-rooms, and barns into something so very different that we

Lomaland Photo. and Engraving Dept.

LOOKING WEST FROM NORTH YAMHILL, OREGON

which are absolutely horrifying, showing as they do the fact that a large percentage of illness and death, particularly among infants, is due to our negligence in allowing flies, covered with filth and disease germs, to walk over our food, swim in the baby's milk cup and infect the medicine of the invalid; and that the most innocuous-looking foods may be cultures of phthisis or typhoid fever germs.

Great excitement is now reported as existing in Marseilles, France, because of the invasion of a certain squalid district in the city by what were at first believed to be poisonous flies. One young woman, "bitten," it is stated, though probably "infected" would be a less inaccurate term, died within a few hours, and two others are dying. Several babies also succumbed before an investigation traced this "visitation of Providence" to its source in the shape of a pile of offal and putrid other things upon which the flies had fed and the poison of which they then proceeded to trail over the food of nearby hu-

will almost want to give them new names.

There will be no odoriferous drains, no fugitive vegetables here and there in the cellar rotting away in peace, no uncovered pails of refuse in the kitchen, no uncovered garbage cans, none with covers that have ceased to fit tightly or which are so overful that the cover will not fall into place, and no more unsanitary stables. There will be no piles of dirty linen in the sick room, no uncovered food or medicine glasses there, no unprotected invalids being feasted upon and walked over.

In short, housekeeping—and this term in its widest application includes most of the sciences, from chemistry to nursing, and all of the arts—will be very different from the apology that so often sails under that name today. In addition, when we consider that in order to insure our own safety it is not sufficient merely to keep our own premises clean, but that our neighbors' precincts must be sanitary, even those many miles distant, we rise to a sense of broader responsibility. H.

OUR YOUNG FOLK

The Epic of Finland

UNTIL the year 1800 the people of Finland had done nothing to bring together the scattered fragments of what now constitutes their national epic, the *Kalevala*. It was known that down through the centuries, since the beginning of the Christian era, the heroic deeds of Wainamoinen, the bard, were sung by the native singers of Finland. The runes or verses were of purely heathen or pre-Christian sources, and were for this reason all the more interesting and valuable.

At the beginning of the last century, therefore, when other countries were awakening to the beauty and worth of their national literature and folk-lore, the Literary Society of Finland selected one of its number, Elias Lönnrot, to collect the scattered runes and bring them together into form. For nearly thirty-five years Lönnrot traveled throughout Finland, collecting the precious verses, and by careful study relating them one to the other.

But valuable as the material was that he gathered, he felt that the great work had been begun almost too late, as already many of the songs, and among these some of the most ancient and beautiful, were but a fading memory among the people, for those who had actually sung the runes had already passed away. When such work as he was able to do was almost completed, he heard of an aged fisherman by the name of Arhippa, living in the northwestern corner of Archangel Land, who was said to be the most famous rune-singer of his time. To Archangel Land the patriotic Finn hastened with all speed, for it was as if a door were just about to be closed, that could never be opened again.

He found the aged peasant, and for three full days the octogenarian sang his runes, while with the utmost care Lönnrot wrote them down. The runes thus obtained form by far the most valuable part of the *Kalevala* as we know it. The aged Arhippa told his guest that he remembered as a boy hearing his father and a neighbor, in the fishing season, singing runes by the fire all night long, for many nights running, and he added that he never remembered hearing them repeat a single story. In this way he had stored the runes in his memory; although it was likely that in the course of time he had forgotten some.

The songs were sung by two bards who sat opposite each other, holding hands and swaying their bodies as they sang. The chief singer began the runes with the customary simple melody; when he had sung one rune his comrade took it up and sang it over again with slight variation and different coloring.

Some maintain of the *Kalevala* that it is of historic origin; others that it is purely mythical, the hero and others of the chief characters being really gods; still others will have it that it is an ideal sprung from the imagination of the people, symbolizing the struggle between light and darkness, good and evil. As similar views, all of which may be true, are held concerning all the world's great epics, it shows at least that Finland, small though it be, may

Lomaland Photo. and Engraving Dept.

MEMBERS OF BOYS' BROTHERHOOD CLUB, GRONINGEN, HOLLAND, ON A PICNIC

claim a true epic. The hero Wainamoinen has been an inspiration to the Finnish folk for thousands of years, and his virtues, fearlessness, power of endurance, and prudence, are native to the Finnish character.

UNCLE OSWALD

BE self-denying, but do not boast of it.

Be independent and moderate, and regard not the opinion or censure of others, but keep a watch upon yourself as your own most dangerous enemy. Do not plume yourself on an intellectual knowledge of philosophy, which is imperfect by itself, but on a consistent nobleness of action.

Never relax your efforts, but aim at perfection. Let everything which seems best be to you a law not to be transgressed; and whenever anything painful, or pleasurable, or glorious, or inglorious, is set before you, remember that now is the struggle, now is the hour of the Olympian contest, and it may not be put off, and that by a single defeat or yielding, your advance in virtue may be either secured or lost. It was thus that Socrates attained perfection. . . . And thou, even if as yet thou are not yet a Socrates, yet shouldst live as though it were thy wish to be one.

Epictetus

Echoes of the Tercentenary Celebration of the Dutch in America

THE splendor and size of the Hudson-Fulton Celebration in New York have comparatively obscured some very interesting facts connected with the early relations of the Dutch to America and the Americans. Before the Hudson-Fulton there was the Hudson-de Vries Celebration, at the old town of Lewes in Delaware, where in 1631, David de Vries, having heard Henry Hudson's attractive description of the spot, founded a Dutch colony known as Zwannen-dael, the "Dale of the Swans." Hudson in his search for the passage

to India had entered the river now known as the Delaware a few days before he sailed up the river which bears his name, and the Hudson-de Vries Celebration commemorated this, though particularly designed to recall the settlement made by de Vries.

Curiously enough, this Delaware locality is very similar to Holland, being low, and intersected by canals. The pageant with its representations of Dutch scenes must have fitted in very well. The peculiar interest attached to the settlement here is that it was the very beginning of the State of Delaware, where there are still many families tracing descent from the Dutch settlers.

In Holland also, occurrences of deep interest have marked the tercentenary, though all the persons and events celebrated do not date so far back. It must interest all boys and girls who have learned to love and honor the great American patriots, to know that at the very time when they were doing their work, they had the very practical and efficient support of a Dutch journalist, Jan Luzac, who fearlessly and continuously wrote in the *Leyden Gazette* in behalf of the American efforts to gain independence. He helped the American cause by publishing all the news he could obtain—and it was very hard to get news in those days of slow-going sailing vessels—and he published the news not only in Dutch, but in French, and so helped very much to let the world of Europe know the course of events and cause the nations to decide accordingly. In the Library of the University of Leyden may still be seen numbers of the *Leyden Gazette* of the years between 1772 and 1785. The many Americans who were present at the unveiling of the memorial tablet to Jan Luzac must have felt very glad to see him honored. Champions of freedom, staunch and true, we learn to expect among the descendants of the "free Frisians."

Charcoal

MANY of you have seen charcoal, I suppose, but perhaps all of you do not know how we get it. It is like so many other useful things a product from our woods.

In Sweden where coal is very scarce, a large amount of charcoal is used at the iron works and other manufacturing places. Some of it is produced in furnaces at the saw-mills, but most of it is charred in large stacks in the woods.

These charring-stacks are most interesting. In winter-time, when the lumber is cut, the wood which is intended for charcoal is piled up and left to dry through the summer and often until the autumn of the following year. Then it is ready to be charred. A level place is chosen, where the ground is dry. Here some large logs are placed in a circle right in the center, so as to form a small shaft or drum, in which the lighting of the stack takes place. The wood is piled up around the drum, the smallest and driest near the center and the outside, the larger in between. The top is covered with spruce twigs over which is strewn sand or charcoal dust. The lighting takes place in the drum. Some redhot charcoal is dropped down to the bottom, the shaft is then filled with coal and the opening at the top is closed. Now and then the drum is opened, and when the coal is consumed, wood is used. This is continued until the upper part of the stack is burned.

A few holes are left open at the bottom so as to let in enough air for combustion. Later some holes are opened at the upper edge for the smoke to pass out through. As soon as the burning wood reaches them, they are closed and new ones are made farther down. Only as much wood is burned as is required to evaporate the water and thoroughly dry and decompose the wood. This is usually done in about four weeks and then the charcoal is ready. It is raked out a little at a time, and carefully watched, so as to prevent it from taking fire.

For piling up of wood and raking out of the charcoal, there must be two men, but only one is needed to watch the stack the rest of the time. All by himself he lives there in his little hut far up in the woods, attending to his stack and smoking his pipe, quite contented with his life. Do not imagine that he feels lonesome! He has many friends up there. The birds, the rabbits, the deer, and even the large stately elk like to keep him company. Many a wonderful thing he can tell you, the old charcoal burner, about giants and trolls, fairies and tomtar. Often he has seen the fairies dance; the tomtar is his dear friend. Many a time when the charcoal-burner has

LULLABY

REST, little one, without a fear,
Without a fear; for far away
The great sea breaks upon the shore
From day to dark, from dark to day;
And all the thunders of its roar,
Through silence filtered o'er and o'er,
In murmurous music hush thine ear!
In murmurous music hush thine ear!

Droop, like the petals of a rose,
A drooping rose, dear eyelids, droop
Above the honey dew of dreams;
While happy slumbers round thee troop
And weave their wings across the gleams
Where life's too vivid tumult streams.
Close, softly close, sweet eyelids, close!
Close, softly close, sweet eyelids, close!

Harriet Prescott Spofford

taken a nap in his cabin and the wind has blown up and made the stack burn up too quickly, he has heard a knock on the door, a warning from old Father Tomte, that now the fire is burning too high.

Stack after stack is often charred on the same bottom and when winter comes with ice and snow, the glistening black charcoal is loaded on sledges and brought down to the nearest railway station from which it is carried out to different parts of the country. BIRGIT

Old Bay

WHEN people question the intelligence of horses such instances as this present themselves, and one wonders how such questioners look upon them.

One of our near neighbors had a good team of horses. He was a kind, considerate driver and when old Bay became lame, the whole family was interested. Some little strain he had thought to be the cause. Despite good home care, the second day he was still too lame to travel and the night being one of intense heat, the owner turned Bay out of the stable to be as comfortable as possible on the lawn, as it seemed so difficult for him to lie down and to rise from the hard stable floor. He thought Bay was too lame to wander away, besides, the horse was not likely to do so at any time.

Early in the morning before he had discovered Bay's disappearance he received a telephone message from the blacksmith's shop saying that Bay was there and needed his immediate attention.

A hasty look about the home showed that he was not there. Upon arriving at the smithy door, with nose as close as possible to where he had been shod so many times, lay old Bay, but past all help even from the kindly smith, and not able even to respond to the greeting of his owner. When his suffering was over, an examination was made which proved his condition to be the fault of the

last shoeing, which had been done in a distant town while he was on a long trip.

If old Bay did not know what his trouble was, and who could relieve him, why did he take his first chance to go to the smithy, although the walk of twelve blocks must have been the greatest agony to him?

Dear old Bay! How the family and the neighbors missed his cheerful tread and ready response to the attentions they all loved to show him. None of them questioned his intelligence or his simple trust that the blacksmith would help him. O. D.

Joy-Signals to the Children

LITTLE by little the children all over the world are learning that a new and much happier time has dawned for them. In many countries are Lotus Groups, and when the little folk come together in these groups, the heart-light becomes so bright that it is a great joy-signal to all the other children of that land. And from Lomaland and the other places where there are Râja Yoga Schools these joy-signals are flying so fast and so far that children are feeling them in the most out of the way places. Sometimes they travel long distances to Lomaland, to find out more about this new joy in children's lives. G.

THE SECRET DOCTRINE

THE
Synthesis of Science, Religion, and Philosophy

By H. P. BLAVATSKY

2 Vols., Royal 8vo., about 1500 pages; cloth.
(Index of 30 Pages as in First Edition)

NEW POINT LOMA EDITION IN PREPARATION

To be reprinted from the original edition of 1888, as published by H. P. Blavatsky

Vol. I treats of Cosmogenesis
Vol. II treats of Anthropogenesis

Postage prepaid - - - - \$10.00

The Higher Office of Science

AN astronomer, dealing with recent Martian controversies, especially as to the presence or absence of water on that planet, remarks that even when the question is settled, no deductions as to habitation can be drawn. If the physical conditions of Mars are not like our physical conditions, it may merely mean that the life there is not like ours. Not even can the opposite be argued — that if the conditions are like, so is the life.

The nucleus of an amoeba in the pond contains for chemistry exactly the same elements as the nucleus of a human brain-cell. The subjective activities of the latter include all those of the former, plus . . . and what a plus! The brain cells even of two men, cells chemically and microscopically indistinguishable, may answer to immense differences of consciousness. One man may live a life little other than animal; the other may be a Beethoven who cares not, almost knows not, when or what he eats. The chemical and physical constitution of planets and stars considered alone,

The Indwelling Motive Force Must Determine

give us therefore no basis for conviction, and cannot do so. Some of the recent philosophies and philosophic talk of getting into touch, or in tune, with the Infinite, meaning the omnipresent cosmic consciousness. Have any of these writers, some of them also men of science, done that, and do they yet in another part of their minds doubt whether Mars is inhabited and wait for their doubts to be resolved by the presence or absence of water there?

In this case certainty must begin and argument follow. To a sufficiently close or minute observer one molecule of phosphorus in a brain-cell would be at an immense distance from another, separated by great spaces and a dozen other elements. Yet he would know that those two, thus separated, are yet linked together as well as linked to the heterogeneous molecules between, by a common and very high function. They are part of the physical basis, and the servants, of consciousness.

The whole of material nature, in all its apparent confusion, may be the same, the physical basis and servant of a plane of cosmic consciousness. May be the same: that is as far as argument can go. To be able to say it is the same, requires that "touch with the Infinite" of which the philosophies speak.

The man of science, if he would but rate his calling high enough, might stand as the link between philosophy and science. Having

brought himself into certain touch with the cosmic and divine consciousness, he might with one department of his nature and one employment of his mind, follow its work downward and see its vast plan coming out even into the lowly life of the amoeba; and with another work upward through his objective details and laws. Only by such double understanding, of the above downward, and of the below upward, can man's mind attain its true growth.

Science justly admits that its highest and most generalized principles and laws are, so far, no real explanations of anything; they are merely shorthand abstracts of vast masses of detailed phenomena. The real explanations

can only come from a philosophy that has advanced from speculation to knowledge and has met and touched the great plan by a trained act of direct

consciousness. Until then, ancient philosophy might look down on modern science as a mere classification of details — just as modern science usually looks down on ancient philosophy as baseless air-flights of imagination. But the faculty of imagination may be made an organ of knowledge. HERBERT CORYN, M. D., M. R. C. S.

The "Bird-Man"

AVIATORS are telling us how it feels to fly and how they seem to master the force of gravitation by the exercise of some power within themselves; and others, who do not themselves aviate, believe they have identified a new type of man, the "bird-man," whose physical and functional peculiarities they describe. The presence of this bird-man is essential to the success of the machine, they say; and they remind us of the typical sailor, who has a similar adaptability to water, and who, one supposes, should be called a "fish-man," or water-man.

We could easily multiply analogies by citing instances of men with an affinity for steel, for chemicals, for cooking, for agriculture, etc., and each endowed with characteristic traits recognizable by the expert in such observations.

Machinery is not everything; one man is not as good as another. An older kind of science has averred that every material substance possessed its own familiar spirit or daimon or elemental, and that the organisms of different men were favorable to one or other of these spirits. The case of the water-diviner would have been cited as a good illustration, as also that of the expert prospector when his powers seem to depend rather on "luck" than on skill.

We are probably verging on a recognition of the fact that the organism of the experi-

menter has an important influence on the success of the experiment; a recognition which, when fully adopted, will initiate a new order of science, differing from the old order in which the physical peculiarities of the researcher are not considered. Some time ago the "Blondlot rays" were announced as a new discovery; but, by all accounts, they were found to be visible to Latin races only and not to Teutonic races; so they fell into disrepute. But perhaps now we may be willing to concede that there are "ray-men" who are specially adapted to the seeing of new kinds of rays.

In short science is getting back in the direction of magic; and soon a man of science will have to be a magician. He will not be able to make the experiments work until he has trained himself up to a certain point, maybe fasted for "forty days and forty nights." We shall have Professor This in one country discovering a new emanation or element, and Professor That in another country vowing that the discovery is false because he cannot make the process work; and for awhile there will be international strife.

The older wisdom of the world always set self-knowledge before action, and regarded the path of wisdom as being primarily a path of self-study and self-development. Are we getting back to this? How can one become a bird-man? Must one be born to it, or is there a special training for it?

It scarcely needs to be said that a Theosophist, in writing thus, has in mind the folly and danger of dabbling in what is called "psychism" without having been prepared beforehand by a course in self-control and self-purification. There is no need to point out the disastrous results of such dabbling, for they are patent. The dangers of arousing sleeping forces and rendering oneself sensitive to unseen influences are great indeed; and it will be found that in every branch of knowledge, self-control is the master-key and the prime requisite.

STUDENT

The Lesson of Evolution

CERTAINLY the word "Evolution" is coming to be understood in a higher and wider sense. It is beginning to be regarded nowadays as including moral factors; will and intelligence are recognized as the agents, instead of the blind forces or abstractions previously imagined; living beings are its *dramatis personae*, and not mere unthinking atoms and cells.

Spencer and others introduced a scheme of "social evolution," but they had an inadequate conception of the "individualism" which was to be the great guiding influence in social evolution. This individualism was not sufficiently discriminated from personal desire; the conflict of personal desires was credited with an efficacy which it does not possess. Later thinkers have realized that social evolution must include less destructive and more intelligent forces than personal desire; and thus they have given a higher meaning to the term "individualism."

In a paper on the lesson of evolution, lately read before the British Association, Professor E. H. Starling draws a parallel between organic evolution and social evolution, weaving happily together the two threads of interest in science and concern over the stability of the British Empire. He gives his views as to what

is necessary for the continued prosperity of that Empire, and seeks to show that his ideas have been derived from a study of organic evolution. Many readers, however, would be disposed to doubt this claim and to surmise that his ideas are partly of an *a priori* nature and partly founded on experience of things in general, and that he has applied them to the elucidation of both organic nature and social polity.

He regards science as exercising a function in the community like that of the sense-organs in the organic kingdoms; but declines the inference that scientific men ought to rule; for it is not the sense-organs that rule, but the brains which co-ordinate the information given by the sense-organs. So in the state there must be rulers. And these rulers must be men of experience and wisdom. He recognizes also that equality does not mean universal similarity; but that though all may have equal opportunities, people will always grade themselves into different ranks according to their abilities and characters.

But the rulers are elected by the people, and therefore it is necessary for the people to possess foresight and individuality, in order that they may appoint rulers in virtue of the wisdom of these rulers, rather than in virtue of their promises.

As a matter of fact the affairs of our states are not determined according to any of these theories, but by politicians, whose measures for the conduct of the community depend in the last resort on the suffrages of their electors—i. e., on the favor of the people as a whole. It has been rightly said that every nation has the government which it deserves. Hence it is all-important that the people themselves should realize the meaning of the message which Darwin delivered fifty years ago. On the choice of the people, not of its politicians, on its power to foresee and to realize the laws which determine success in the struggle for existence, depends the future of our race. It is the people that must elect men as their rulers in virtue of their wisdom rather than of their promises. It is the people that must insist on the provision of the organs of foresight, the workshops of exact knowledge. It is the individual who must be prepared to give up his own freedom and ease for the welfare of the community. (Quoted from an abstract in *The Scientific American Supplement*)

It is probably going too far to credit the biological theory of evolution with teaching us all this; but at all events it is true and is becoming more generally recognized. And observe, it is the people's conscience that it appealed to. No longer are we bidden to adopt the *laissez faire* attitude and trust that the desires and propensities of the people will ultimately work out to their good if not interfered with by the government. That doctrine is relegated to the top shelf. The desires of the people will not lead them onward but backward. We must arouse something else in them. This is the real agent of evolution. If biological evolution has taught us this, it must be inferred that biologists recognize the working of a higher law in the animal kingdom and have found their old theories insufficient to account for what they have found in Nature. Truly it is a new order of things when we are told that science has discovered a moral law in Nature and is beginning to apply this moral law to the case of man and social evolution! It is no new thing for the churches to claim to be the initiators of reforms; but here we have science making that claim; science has saved us from materialism!

T.

What is a Gentleman?

FROM time to time the correspondence columns of newspapers exercise themselves over the question, What is a Gentleman?

The answers given by various correspondents show that the word actually corresponds to a certain ideal, held in the human mind, of real sublimity, incapable of definition, and only to be forthshadowed by long descriptions and lists of qualities.

Perfect self-possession upon all occasions seems to be one of the chief characteristics. The poor well-meaning but often disgruntled Nietzsche is quoted in the *New York Sun* as follows:

A gentleman is always a man of more than average influence and power, and his superiority is usually admitted by all. The vulgarian may boast of his bluff honesty, but at heart he looks up to the gentleman, who goes through life serene and imperturbable. There is in the gentleman an unmistakable air of fitness and efficiency, and this makes him considerate, gentle and tolerant to those below him.

The demeanor of high born persons shows plainly that in their minds is the ever present consciousness of power. Above all things, they strive to avoid a show of weakness, whether it takes the form of inefficiency or of a too easy yielding to passion or emotion. They never sink exhausted in a chair. On the train, when the vulgar try to make themselves comfortable, these higher folk avoid reclining. They do not seem to get tired after hours of standing at court. They do not furnish their houses in a comfortable but in a spacious and dignified manner, as if they were the abodes of a greater and taller race of beings. To a provoking speech they reply with politeness and self-possession, and not as if horrified, crushed, abashed, enraged or out of breath, after the manner of plebeians.

The aristocrat knows how to preserve the appearance of ever present physical strength, and he knows, too, how to convey the impression that his soul and intellect are a match to all dangers and surprises, by keeping up an unchanging serenity and civility, even under the most trying circumstances.

Nietzsche, perhaps, does not emphasize enough the distinction between affectation and genuine feeling. Does the real gentleman merely seek to "convey an impression"? The man who does so might more fitly be described as one who aspired ardently to the goal but had not quite reached it.

Of course any strain of affectation, however slight, would be an element of weakness, which, however well concealed, would often result in effects that would mar the character. To the wife, to the valet, this gentleman would sometimes betray himself. Hence the real gentleman must have the real unassumed strength of character which makes his self-possession and chivalry genuinely unaffected.

Thus we see that the gentleman must be a man of deep knowledge and will-power. All this perfection of character must be based on some sure foundation within. He must be a profound believer in the sufficiency of human nature and must look upon life as an object in itself, and upon himself as an artist whose function is to live it well and nobly.

It is scarcely necessary to indicate the great contrast between such an ideal and the ideal of human nature usually fostered by our formal religions. If a gentleman is religious, he is religious in his own way and knows how to keep it to himself. If he could find any form of professed religion which would not demean him in his own estimation, he might embrace it. We should faithfully cherish this ancient ideal of chivalry.

STUDENT

Some Views on XXth Century Problems

Magic and Mediumship

"SPIRITUALISM of today is the 'magic' of the past," says a reviewer of Mr. Carrington's much-reviewed book on *Hindu Magic*:

Of both the same phenomena are reported; in the case of both there is so much smoke that from that fact alone we must assume that in the middle there must be some real fire.

The writer of the book describes a number of ordinary "fakir" feats and shows how with a considerable amount of preliminary preparation, apparatus, and disposal of the spectators they might be imitated—done, he would say.

Without insisting now upon the fact that all these feats are frequently done without the apparatus and with no particular disposal of the spectators, without in fact any of the needfuls of the ordinary conjurer, we pass on to note that there are a number of phenomena which Mr. Carrington thinks are genuine. It will be seen, he says, that all these—he enumerates

raps, telekinetic phenomena, independent writing, levitations, materializations, playing upon an accordion, etc. . . . bear a close resemblance to the mediumistic phenomena witnessed in other countries. . . . It shows us, at all events, that some, and perhaps much, good may come from a close study of these wonder-workers.

If the medium of our peoples did, in his own way, all that the genuine "fakir" does, it would not therefore follow that they were not at opposite poles. The fakir knows and announces exactly what he is going to do and does that exact thing and nothing else. And—unless the feat happens to be the entry into and remaining in a trance—does it without lapse of consciousness or an attack of semi-epilepsy. The medium usually does *not* know what is going to happen; things happen other than and beyond any announcement he may have made; or nothing may happen; he cannot prophesy. And any "feat" usually requires the loss of his consciousness and self-control, often a set of muscular twitchings resembling minor epilepsy, great subsequent exhaustion, and nearly always after a few years some grave disease. In other words, the medium gives up his will, and the special force concerned in the working of the phenomena follows other, or no, guidance. In the case of the fakir that same force is controlled by a uniquely trained will that never goes off duty.

Fakirism, in fact, represents the lowest manifestation of a science or art which may be said with nearly complete truth to have withdrawn from the world. It rested on the forgotten fact that man contains in himself some of the creative or fashioning force that upholds the universe, and that when he has come to true self-knowledge he finds that this force is by the very nature of his developed being at the service of his will. In its highest reaches this development demands absolute self-mergence or mergence of self-interest in the interest of the totality of lives, especially of other men—that is, compassion. In its very lowest, that of the fakir, it demands a sternness of self-denial of which our Western gen-

erations do not seem capable. Mr. Carrington certainly did not sufficiently gain the confidence of a fakir to get himself informed as to the code of life which must be led for many years.

We should like to hear one of these old fellows' comments on some of the modern *will-culture made easy* systems. That people could ever think that by payment of a fee it might be done *for them*, would probably be beyond his powers of belief. STUDENT

Duality in Language and Human Nature

IN his recent book on *Modern English*, Professor Krapp of Cincinnati argues against the use of a language of literature as distinct from the language of common speech. To the latter the literary man should constantly turn, striving to divest his language of any special dignity or elevation that would not be found gracing the colloquial lip. The popular opinion, he says, is not usually in accord with such a view:

It is often believed that the language of literature is something different from and better than the language of speech. . . . It is supposed that the ability to use the English of literature is a special and acquired accomplishment, and that one learns the language of literature as one learns a new art, like playing the piano or painting.

Language is for the expression of consciousness. The literature of a nation embodies its *highest* consciousness as well as its common or colloquial consciousness. The man who has power to write the former and now proposes to do so, is not the same man as that same man chatting colloquially with a friend in the street. He consciously rises to the highest self of himself that he can reach, the highest state of feeling possible to him, and from there delivers himself. And he can only do so with a fitting instrument of expression. He must select words and suites of words that will carry high feeling, and, moreover, so carry it *as to awake it in those who read*. No colloquial language used by men on the street or after dinner, no language used at all by the immense majority of men, will do that.

The contention really says that men have no scale of consciousness; that the man at the dinner table is all there is of that man. But the literary man, in the highest sense, knows that there are moments when he is almost transformed; when, looking in memory at himself at the dinner table, he seems almost to see some other creature. Yet he is to be expected, when the light of his soul is upon him and transfiguring all things, to use the language of the wine and walnuts!

Language is capable of becoming a variety of music, making the same appeal as music to the ranges of feeling. As well say that the musician should not use any further ranges and qualities of tone than are in the voices of men chatting at the street corner, as that the man of true literature should refrain from the higher reaches of *his* instrument.

Literature is one of the means whereby men carry to others the results of the working of their highest consciousness. The mere statement of facts is not literature, unless a very unusual extension is given to the word facts.

During the French Revolution a series of events occurred which might be tabulated in a long list of facts. It might be as complete as you please and yet fail to convey *the* fact of all—that a nation woke from the lethargy of centuries and passed in storm and agony, partly failing, partly succeeding, to a new consciousness. STUDENT

Flattering the Spooks

PROFESSORS of science and philosophy who accept in various degrees the phenomena of spiritism seem curiously reluctant to accept the hypothesis of the spook. We do not mean the hypothesis advanced by the spook, for there is not one, but a countless multitude of these, none of them advanced as hypothesis but as "teaching." The *teaching* of the spook always is that he is an entire human entity, entire except as to the body, which even he can hardly deny that he lacks. Some of the researchers accept him at his own valuation and are at once landed in extraordinary difficulties. Others fully perceive his incapacities and limitations, but instead of getting from them a suggestion as to what he really is—the shell of a withdrawn mind—explain him by something that needs much more explanation. Professor James, for instance, discussing him in a popular contemporary, says:

My own dramatic sense tends instinctively to picture the situation as an interaction between slumbering faculties in the automatist's (medium's) mind and a cosmic environment of *other consciousness* of some sort which is able to work upon it. If there were in the universe a lot of diffuse soul-stuff, unable of itself to get into consistent personal form, or to take permanent possession of an organism, yet always craving to do so, it might get its head into the air, parasitically, so to speak, by profiting by weak spots in the armor of human minds, and slipping in and stirring up there the sleeping tendency to personate. It would induce habits in the subconscious region of the mind it used thus, and would seek above all things to prolong its social opportunities by making itself agreeable and plausible. It would drag away scraps of truth with it from the wider environment, but would betray its mental inferiority by knowing little how to weave them into any important or significant story.

Nearly all that will do as an admirable description of the spook. But the "wider environment" from which the scraps of truth are "dragged away" usually consists entirely of the minds and latent memories of the investigating circle. If any wider environment is touched it is not by the spook but by one of those minds.

Professor Lombroso, we note, also misses the obvious solution. The two explanations of the phenomena which he considers are the "vito-physiological," in which everything is made to depend upon extensions of the medium's vital principles—the *living* shell, to which some of the phenomena *are* due; and that in which the spook is taken at his own valuation as a human entity. Rejecting the former he has only the latter.

In which case the world to which we retire after death is largely peopled by masqueraders, tricksters, liars, and idiots.

Why do the researchers give themselves so much unnecessary trouble? STUDENT

Archaeology Palaeontology Ethnology

Caerphilly Castle

CAERPHILLY Castle, Wales, is one of the most magnificent ruins in all that land of ruined strongholds. It covers more ground than any other ruin in Great Britain. The walls are of immense strength and thickness; the mortar is almost harder than the stones. One of the towers has been leaning at a great angle for centuries; it would still take gunpowder or a great earthquake to bring it down.

Coming up from Cardiff one crosses a tract of level land, and then the long wild Cefn Carnau Mountain, which rises gently from the plain on the sea-facing side, and rears itself steep above Caerphilly on the north. One looks down from Cefn Carnau over the green valley, and the huge ruin seems to be directly below; in reality the castle is on a hill of its own, and dominates the valley and the village about its feet. From the grass-grown floors of the great halls one sees the jackdaws, familiar and fearless in the streets of all Welsh towns, circling and alighting high above in the inaccessible towers; the old winding stone stairs will still carry one safely to the gallery of the first story, running round in the thickness of the wall, but no farther. It is all huge and admirable and strong, and on an altogether grander scale than the ordinary Norman garrison castles in Wales, or the hill-crowning seats of the Welsh princes.

Caerphilly Castle was built by Earl Gilbert of Clare and Glamorgan somewhere in the sixties of the thirteenth century, and from its building to its dismantlement it was the scene of many excursions and alarms, and much uninteresting bloodshed. It was twice taken by Llewelyn the Last, and whenever there was any fighting in Wales or England, Caerphilly Castle was sure to come in for its share of it. If the Welsh were not besieging it, some faction of the English would be, either the Queen's men or Despenser's men or the King's men or the barons; the whole story is intricate and only relieved here and there by anything like nobility or heroism. It was destroyed and rebuilt more than once, and only one final outstanding fact remains to be mentioned: its dismantlement in the beginning of the fifteenth century by Owen Glyndwr. There would be but little interest about Caerphilly if its history began with the building of the Castle.

In 1402 Owen, crowned king of Wales, and with his parliament meeting at Machynlleth in the north, drove the English out of the greater part of Glamorgan. In the following year Henry IV invaded Wales with his whole strength, and was utterly defeated by Owen at Cowbridge, about fifteen miles from Caerphilly, after eighteen hours fighting. Then Owen took Caerphilly and dismantled it, and made it useless forever for warlike purposes but kept it habitable as a royal residence or for some other use.

This Owen Glyndwr was certainly one of

Lomaland Photo. and Engraving Dept.

CAERPHILLY CASTLE, NEAR CARDIFF, WALES

the greatest men of his age. He was great enough as a soldier to drive the English out of Wales, winning his chief pitched battles, not among the mountains, but on the plains of south Glamorgan, where no advantage was to be had from the mountain methods natural to the Welsh. He was great enough as a statesman to call a parliament in that pre-parliamentarian time, and to prepare a constitution for Wales. But perhaps the greatest thing about him was his desire to establish a grand system of education. He would have revived the old universities of Wales; would have had them great seats of learning and Bardic wisdom. He would have had the whole people literate; would have driven out the church of Rome, and replaced it with the purer and older Celtic church; indeed, there can hardly be any doubt that he looked to see the Bardic schools, with their pre-Christian masonry and mysticism, at the head of education and religion in Wales. For these reasons, perhaps, he spared Caerphilly from the ruin he put on the other Norman strongholds of Glamorgan; for the really interesting fact about the place from the Theosophical standpoint remains yet to be told.

For Caerphilly or Senghenydd, to give it its earlier name, was, long before the Normans came and converted it into a fortress, an old Welsh seat of learning. In the fifth and sixth centuries, when what is now called England was all more or less a great battlefield between the Britons and the ever-increasing Saxon hordes, the southeast of Wales contained nearly all there was of light and learning in Britain. A few miles northeast of Cardiff is Caerlleon on Usk, one of the quaintest and most interesting towns in existence. In those days it was the capital of the Briton kings and of civilization. Within a few miles west of Cardiff there were two flourishing colleges, the Bardic monasteries of Llancarvan and Llanilltud; the former being a purely Welsh institution, while in the latter there were many scholars from Ireland and the west of Europe generally.

The most celebrated long poem in Welsh is

the Gododin, which tells of a terrible defeat of the Britons at Cattraeth in the north; only one man is said to have escaped — Aneurin, the author of the poem, one of the four great poets of his age. His lordship lost at Cattraeth, Aneurin took refuge in Glamorgan, far from the seat of war, and became a member of the Celled Bards Choir, or monastery or university of Llancarvan, whose head at that time was Catwg the Wise. Here his son Cenydd grew up, who in his turn founded the third of the universities of Glamorgan at Senghenydd, named after him, on the Cledar brook under Cefn Carnau. They were all saints and bards, these men, but of the British church, never canonized in Rome. A part of Caerphilly is still called the Gwyndy, the white, or better, the sacred, house, for all these old colleges were looked upon as sacred.

None of the records of Senghenydd are known; the Normans were in the habit of burning all such records when they found them, and it was when the Normans took Caerphilly that it ceased to be a center of learning and was converted into a stronghold. Yet there may be old memories hidden there somewhere, to come to light at their proper time.

Gigantic Fossil Shells

THE engineers boring the Gunnison tunnel, Uncompahgre irrigation project,

Colorado, had their work delayed by finding in the black shales an accumulation of thousands upon thousands of sea-shells, some of them three feet and more in diameter, which caused great danger by making the roof treacherous and liable to cave in suddenly. Like other details of the Mesozoic fauna, this illustrates the fact that the evolution of organisms does not always imply an increase in size as time goes on; but that the opposite process also obtains. Certain forms wax, reach their maximum, decline or disappear altogether; and other forms take their places.

There is much to be learned from Palaeontology, if we attend to the facts.

✻ The Trend of Twentieth Century Science ✻

The Sense of Direction

IN a monthly contemporary, Professor Watson of Johns Hopkins University describes how he attacked and to some extent solved the question of the "homing sense" of birds and some other animals. His researches were limited not only to birds, but to two species of birds. But once that some such sense or power has been proved for even one species of animal a great deal has been done.

For it is now the fashion to deny the existence of it and to attribute the cases of distant orientation to some amount of familiarity with the scenery. This notwithstanding the now hundreds of reported cases of the return to their old homes of cats and dogs carried (enclosed) to great distances by rail.

In the case of homing pigeons, which may even return from a thousand miles distance, it cannot be exactly proved that the process of training did not make them familiar with some of the larger scenic landmarks. As Professor Watson says:

If the bird is five hundred miles from his home, and there is a mountain range between him and his home, it would serve the same purpose for him to perceive this mountain range and direct his flight towards it as if he could directly perceive his nest and young. . . . Furthermore, until we have more accurate records both of the number of birds which return and those which do not, we can never be sure that the exceptional bird which does get home has not accomplished it by accidentally flying into familiar territory.

The two species of birds which were used by the Professor to settle the question dwell on Bird Key,

a little deserted mound of sand about three hundred yards in diameter lying in the middle of the Gulf of Mexico.

They are varieties of the gull and rejoice in the respective names of the sooty and noddy terns. Study of their habits showed that in their search for food they do not go farther than from fifteen to eighteen miles over the water. From Bird Key to Cape Hatteras the distance over the water in a straight line is about eight hundred and fifty miles. The along-shore route is two hundred and thirty miles more. This distance would obviously do for a conclusive test, if any test could be conclusive.

After egg-laying, one bird sits on the nest and can easily be captured; the other goes foraging. On the morning of June 13, five of these nesters were taken, marked with paint, transported to Cape Hatteras, and there liberated on the morning of June 16. On June 21 two of the marked birds were found on their respective nests. The mates of the other three absentees, perhaps regarding themselves as widows or widowers, had taken new partners. Consequently had the marked birds returned they would have been unable to obtain possession of the nests. But a few days later the Professor saw one of the belated absentees returning and trying vainly to establish his right to his own nest. Three of the five were thus accounted for, and the Professor says he has little doubt that the other two also returned in due course to their homes, adding:

It seems to me that the "visual landmark" theory of distant orientation is forever exploded by these tests. What we shall put in place of it is difficult to decide.

If a special "homing sense" be postulated by any speculator, upon that speculator, he thinks, lies at once the duty of saying where that sense is located and what is its relation to the other senses.

Not necessarily. There is a special *time* sense, which enables many people to wake at the very moment upon which they have decided hours before. Are we, in postulating that, compelled to say exactly where in the body it dwells and how it is related to the sense of smell?

To call this other a *space* sense would be to try to establish an at any rate partially false analogy. The waker will in any case reach the determined point of time; all he has to do is to recognize it when he gets to it. But space is *three* dimensional, and mere movement onward will *not* necessarily bring you to any given point. We must postulate a sense which recognizes longitude and latitude.

Training the Deaf

AFRENCH expert finds that deaf-mutes and persons whose deafness is of post-natal origin, are rarely absolutely deaf. In both cases what little hearing there is can be greatly extended. Though he does not say so, the processes are probably different. In the first case the normal apparatus is gradually awakened; in the second the recovery may be like that which is sometimes aimed at in writers' cramp, where the worn-out muscles are let alone and a new set trained to cover their work. In the case of destroyed hearing the patient has to be trained to place his whole attention upon vibrations reaching the inner organ of hearing through the bones of the head in general instead of along the special path afforded by the healthy ear. This training is accomplished by furnishing the vowels one by one.

M. Marage uses five sirens—artificial sound-makers—yielding respectively the five vowels in the English words room, roam, ah, lay, and we. The intensity of sound from each siren can be varied at will, and also the pitch of the note. Patients who cannot hear any of the vowels at any degree of intensity or at any pitch are of course very rare. They usually hear some one of the vowels at some pitch and intensity; sometimes they can be made to hear more of them, or all; but in that case one is easier than the rest. A beginning is thus made, and as the patient is made to strain his attention he gradually hears at a lower degree of intensity and at other pitches. The same process is continued with the other vowels until at last machines are not needed and the human voice can continue the work. Just as we teach children to read by beginning with the alphabet, says M. Marage, so we should develop the hearing of deaf-mutes. The complex and variable vibrations of the voice should be preceded by the simple and exact vibrations of the vowel siren. Two months

thus suffices for results which in the other case would need several years, the fatigue to teachers and pupil being reduced to a minimum.

In some of these cases, hearing has to remain in partial dependence upon sight. The vowels come to be heard; for the consonants the patient may have to watch the mouth. C.

Ancient Life Today

IT is to the soil, contends the geologist Mr. E. H. L. Schwartz, not to the sea, that we must look for the representatives of the most ancient life on earth. The first organic beings must have been able to live, as do some of their modern representatives now, on inorganic matter:

In Krakatoa the whole island had been reduced (by its volcano) to a mass of glowing ash; but still, after a short interval, the surface became slimy with micro-organisms busily breaking down the silicates and forming a soil which the higher plants, later on, would take advantage of.

Nor had they necessarily to wait until the soil was very cool. In some of our hot-springs there are algae which can tolerate a temperature not far from that of boiling water. And there are micro-organisms in every soil which break up silicates for their cell-wall, take direct all the salts they want, and transform the carbon and nitrogen in the air for their tissues.

It has been proved for some plants, and is probable for all, that they are served by these lower organisms. They *can* do what is done *for* them, even fix atmospheric nitrogen; but they have probably attained their development by relinquishing a good deal of what may be called the menial work, living in a sort of partnership with humbler forms of life. It is these forms, still existing, which, thinks Mr. Schwartz, represent the earliest products of the transition between inorganic and organic.

STUDENT

The Teachability of Metals

IT has been known for a long time that metals can be poisoned, anaesthetized, that they get tired, recover with rest, grow old, and have diseases, all in a very human way. It now turns out that they can be taught and will learn. An English metallurgist, Mr. Bairstow, has discovered this with respect to iron and steel. He finds that iron and steel will at length adjust themselves to variations of stress, rhythmically applied, if these are kept up long enough. After the adjustment has been accomplished the metal is perfectly elastic in its whole extent and unless the strain is increased beyond its powers of accommodation, will remain so. It has lengthened *itself* during the process of tuition to the same degree as a similar but "uneducated" piece would have *been lengthened* by a load in excess of its resisting power. But the self-achieved lengthening involves no loss of elasticity; the other does. In the latter case the crystals have slipped upon each other, and there are minute cracks prepared to deepen into fractures.

So it seems that within the limits of its intelligence a piece of iron can be trained to understand a new situation.

Nature

Studies

San Diego County

IT is unnecessary to introduce a scene from the Golden West with any verbal description, for those who know it do not require such a description, and those who do not know it should take the first opportunity of improving their acquaintance. It has been called the Land of Promise; but for that Promise to be turned into Performance something more than natural advantages is needed. We do not want to see the Golden West go the way of so many other beautiful spots which have succumbed to the devastating hand of our civilization. Hence one of the greatest assets which the West has is the Headquarters of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, for this Movement is one of the influences that so alter the lives of men that they may be able to utilize natural attractions instead of spoiling them. Theosophy has shown its appreciation of the advantages and possibilities of this region by locating therein its International Center. From this center is radiating a new light destined to remold civilization on lines of greater harmony, so that man may become the coadjutor of bountiful Nature and learn to utilize her resources wisely. Let us not neglect our opportunities, but remember that as in station, so in scenery, *Noblesse oblige*.

E.

The Builders in the Soil

THE universal presence of the creative powers in Nature is revealed by faithful observation and enthusiastically recognized by the unclouded intelligence of the observer. We are passing beyond the days of the personal god endowed with human attributes and of the blind forces of materialistic science, both fetishes of our own imagination, obscuring our vision of the truth. Instead we now see that all Nature is indeed alive and sentient, not merely peopled with living beings, but actually consisting of nothing else, the very atoms of dirt under our feet being alive and intelligent in their degree.

In Krakatoa the titanic eruption and earthquake had reduced the island to a mass of red-hot ashes; yet in 1886, three years later, the primitive rocks were found *teeming with organic life*. The surface "was slimy with

micro-organisms busily breaking down the silicates" and forming a soil for the plants that were to come. This leads a geologist, in *Science Progress*, into an enthusiastic speculation as to the state of the earth when it was still too hot from its fiery birth for plants and animals. Then, perhaps, it was the scene of myriads of micro-organisms, slimily breaking down the silicates for all they were worth, and preparing a soil for the future plants.

But where do, and where did, these micro-organisms come from? Are they generated from the rocks themselves or do they come swarming through the air as microscopic germs? The germs of life are everywhere, and experiments on sterilization indicate that they are chiefly in the air. How did the first germs of life get to the earth? Sir W. Thomson supposed that they might have dropped from a passing comet or meteor—a theory which only postpones the difficulty. There never was a time when the earth was entirely without life, for wherever there is a vestige of matter, however tenuous, there is life. It is not implied, however, that this mineral life will of itself generate vegetable life; for the astral life-monads which cause life on the physical plane accomplish their evolution on the astral plane. The mineral life in the feldspars needs the presence of the monads of higher type in order for the higher forms to be generated. But we can never explain the

origin of life without admitting that its appearance on the physical plane implies its pre-existence on the astral plane.

An interesting question is: To what kingdom do these micro-organisms belong? They are described as working on the silicates, getting ready soil for the future plants. So they can hardly be plants; and to call them animals would be to reverse the order of evolution. Again they are hardly mineral life; for they break down mineral life. It seems as if a new kingdom were needed.

The revelation of all this busy and complex life going on in the soil is of the greatest interest and importance to agriculturists. The soil is not that much dead matter. It is a sub-kingdom of Nature that collaborates with the vegetable kingdom.

STUDENT

Solidarity and Resources

IT seems quite likely that much of the desiccation and destruction of the sites of ancient civilizations was due to disintegration among the people, whereby the natural resources were no longer kept up and guarded. Irrigation works became choked and the cutting down of timber turned fertile regions into deserts. By a reversal of the process barren spots can be restored; as has happened in the well-known case of the French Landes, where the tracts of moving sand-dunes have been converted by judicious tree-planting and management into fertile regions.

Theosophy in the Welsh Legends---II

NOW before proceeding with the attempt to interpret this story of the Wonderful Head, it would be well to remind ourselves of the importance of this study of the ancient mythology. It has—or may have and ought to have—a far greater value than that of mere archaeological research. Some things you can dig up from the old records, which relate no more than a few dry facts about our forefathers. Other antiquities, again speak of their beliefs and philosophies, and these are of grand importance; although, to tell the truth, you can get the philosophy “quite as well and a great deal better” from the writings of H. P. Blavatsky and William Q. Judge. But these stories give us something else as well; they show the method of teaching that was possible in those old days when men’s minds were freer and more flowing, and their lives straighter and cleaner and simpler, alas, than ours are now. And this method, I think, cannot fail to be inspiring; with its appeal to one’s imagination, to one’s sense of the beautiful, the rhythmic, the grandiose. We are brought into a more intimate touch with the ideals and aspirations of the ancients, and learn their likeness and unlikeness to ourselves; we become their companions in heroic feeling, and a sense of the loftiness of life flows into us, the loftiness and the magic.

You should note how the bards had certain set phrases, which come sweeping through their stories again and again; till one gets to expect them, in a sense, and enjoy them by anticipation; beautiful and resounding phrases they are. They are put in for very much the same reason as we find rhyme in poetry, rhyme and rhythm. And that is, because the soul is rhythmic, and works in recurring cycles. It is only where you get the work of the human mind, with its flaunting independence, that you find this regular and musical sweep of things cease to be. The stars move in their orbits, and the seasons follow one another in due order; one spring rhymes with another, as you may say; and the fall of one wave rhymes with the fall of the next wave; and the grand motions of our souls have the same ordered sweep and grand, resonant surge and swell and waning. So that this pattern is that of the inner part of our being; it is framed, not in accordance with the daily, commonplace drudges that traffic in our minds; but after the fashion of the deepest part of our nature.

This being so, the philosophy of these stories is really taught in a deeper way than the mind is conscious of. You are carried on from one lone, majestic picture to another; and then, if your imagination does not begin to flame up, and disconnect itself from the petty things that go to make our lives petty, and the evil things that balk the whole flow and action of our souls, it is rather your own fault than the story’s. This is the point: that beauty is a part of life—and the best part of it at that, if it be real beauty. You cannot have a whole, sane life with only intellectual thought, or even only the practice of ethics; you must have the beautiful; you must train the imagination to deal in grand and majestic and sunbright ideas. Beauty—that is, beauty of the high, unsensuous and imperishable kind—is the very food and nourishment of the soul; the soul wants the big and splendid things, and that we should leave off thinking of such matters as are merely personal.

We were dealing in the last paper with the Ar-

thurian legend, one of the three great fountains of Welsh romance, and saw how it had been bandied about the world from mouth to mouth, gaining in its travels whole mountains of foreign matter and accretions that have nothing to do with the real thing at all, and are quite empty of Theosophy. We saw, for instance, how the Norman trouveurs had made of the father of Arthur an individual *Uther Pendragon* instead of the mythological *Uthr Benddraig*, the Wonderful Head; falling into this mistake because they did not understand Welsh, and because they did not understand Theosophy. We saw, too, how this Wonderful Head, the Macroprosopos of the Kabalists, symbolizes the Eternal Spirit or Self of the Universe, which, in its descent into matter, does not actually enter into, but rather overshadows the human body, as the Uthr Ben, in its journey towards London to reign over the Island of the Mighty, failed to actually arrive there and become king; that being reserved for its—or his—son Arthur, who represents the human soul, Manas, the divine mind in ourselves. For a clear idea of the teaching implied here, one ought to study the mysticism of Plato, and of the Neo-Platonists and Gnostics; for, as said above, the science of symbolism is universal; there was a time when all the nations possessed their Theosophy, and veiled and expressed it in the same symbolic way.

Nor could one give any explanation of the story, without some reference to H. P. Blavatsky’s teaching about the seven principles of man, the seven centers of being that are in us; I do not mean in our bodies, but in our psychic and spiritual make-up. These principles, or some of them, will always be found figuring as the chief characters in the sacred ancient myths; so that it would be useless to attempt an explanation of the stories, without first becoming acquainted with the principles.

Man, then, is divided into two parts; one immortal and divine, and the other transitory and subject to birth and death. The higher part of him is divided into three principles, to which these names have been given:

First and highest, the Spirit, *Ātmā* by the Sanskrit name that Mme. Blavatsky used; the eternal essence, universal and unparticularized; one in all humanity; we might call it God.

Second, the spiritual soul or *Buddhi*, the vehicle of *Ātmā*; the highest purely human and individualized principle. It manifests as intuition, and from it comes the inspiration of genius.

Third, the human soul, the higher mind, *Manas*; itself the vehicle of *Buddhi* or the spiritual soul. It is essentially the possession of this human soul that makes us man; mind is the offshoot of it.

No need to classify the lower principles here, because we are so familiar with all of them in our own lives, that we shall recognize them well enough should their names have occasion to be mentioned. The point I wish to make clear at present is this: that in these old stories the Bards who handed them down from one generation to another were speaking of these human principles when they spoke of their heroes.

To come back to the Welsh legend, we see the Wonderful Head, the Spirit, endeavoring to come into Britain, endeavoring to incarnate, to come down into matter. The first stopping-place on the journey was Harlech in Ardudwy, whence the March of the Men of Harlech, that famous battle-tune. Here they were for eight years while the Birds of Rhianon sang to them; and so magical was that music that it seemed to them that they had been there barely one day when they arose to go. Is it not evident that this place of magical music represents that high center in man whence all music comes, and all the inspiration of genius; the region of the diviner and intuitional part of the soul? Then in Gwalas we find these two elements: first, that the Wonderful Head is giving teaching and instruction to the Seven; and second, that it was there that temptation came to Heilyn the son of Gwyn; the sudden, ardent and passionate wish to escape, to rise up and go out; and are not these

the marks of that familiar side of our nature, of which we are all conscious, the thinking or intellectual, and the passionate, impulsive side of us?

Now of all the Arthurian stories, there is just one in the old Welsh, and none at all anywhere else, that remains for us in its native purity, and untarnished with what we will call the modern spirit of personality and petty aim. We must forget all we have ever read about tournaments and Sir Lancelot and the meanhearted Sir Kay of Malory, and just get a new idea of the hugeness of ancient conceptions from this story of *Culhwch and Olwen*. Speaking of Sir Kay reminds one that there is a fine picture of the difference between the Welsh bardic feelings and ideas, and those of the Norman minstrels to whom the world owes its knowledge of the Arthurian legend, to be had from a comparison of this Welsh account of him with the account one finds in Tennyson and Malory. You remember the meager-souled and jealous creature that Sir Kay is in the *Idylls of the King*? Now here is the description of him from *Culhwch and Olwen*; please note the difference in spirit between the two, and you will have the key to the difference between the genius of the bards, and the—shall we call it genius?—of the later trouveurs and minstrels.

“Thereupon Cai rose up. Very subtle was Cai. When it pleased him he could make himself as tall as the tallest tree in the forest, and when it pleased him he could make himself as small as the smallest ant in the grass. A wound from Cai’s sword no physician could ever heal. And he had another peculiarity: so great was the heat of his nature, that when it rained it remained dry for a hand’s breadth above, and a hand’s breadth below his hand; and he was to his companions as kindling wherewith to light their fire.”

But to come to our story: *Culhwch* the son of *Cilydd* the son of the Prince of *Celyddon*, was laid under a ban, that he should never marry anyone except *Olwen* the daughter of *Yspaddaden Pencawr*. Who this *Olwen* was, or where was to be found *Yspaddaden* Head of Giants, her father, there was no one that knew; yet no sooner was the ban laid upon him than he was filled with the determination to find her, and went forward to obtain the help of his cousin the Emperor Arthur.

Now the hero of this particular class of story always represents the personal man, ourselves as we find ourselves; with our divinity, the great soul at the back of our being, as yet undiscovered; and the quest that is laid before him, and the adventures that he meets by the way, are the cardinal fact, with its incidents, that comes sooner or later into all lives; the quest of quests, to come out from the personal life into life impersonal; to reach the true self; to obtain immortal wisdom and happiness. Remember those three higher principles of man, *Ātmā*, *Buddhi*, and *Manas*; Spirit, spiritual soul, and human soul. *Buddhi*, the spiritual soul, is the one to be noted here, as being personified in the object of the quest. It is innate in all, but slumbering in the run of us. All the inspirations of genius, and that quick wisdom which does not require to learn or reason laboriously, but knows brightly and certainly the truth of things, as it were of its own knowledge, are sprung from this center. This is the princess, or sometimes the prince, of the fairytales; according to whether the seeker be hero or heroine. We are never given any personal traits or character-painting of this bright one; for obviously there can be no traits or personality to describe. The figure and beauty of her indeed, are set for us here in a clear light of poetry, for it is the essence of these tales that you must see everything as it passes:

“More yellow was her hair than the flower of the broom, and her skin was whiter than the foam of the wave, and more delicate were her hands and her fingers than the blossoms of the wood-anemone amid the spray of the meadow-fountain. The eye of the trained hawk, the glance of the three-mewed falcon, was not so bright as hers. Wherever she walked, four white trefoils sprang up and blossomed

in her footsteps; and therefore was she called Olwen, the All-white One."

This is she that was sought, then; and to find her prototype within you, is to come into your genius and immortality. And the seeker, Culhwch, who

"rode forth upon a steed with head dappled gray, of four winters old, firm of limb, with shell-formed hoofs, having a bridle of linked gold upon his head, and upon him a saddle of costly gold. And in the youth's hand were two spears of silver, sharp, well-tempered, headed with steel, of an edge to wound the wind and cause blood to flow from it, and faster should the flow be than the fall of the dew-drop from the reed and the blade of grass in the morning when the dew of June is at its heaviest. A gold-hilted sword was at his thigh, the blade of which was of gold, bearing a cross of inlaid gold of the hue of the lightning of heaven; his war-horn was of ivory. Before him were two brindled, white-breasted greyhounds, having strong collars of rubies about their necks, reaching from the shoulder to the ear. And the one that was on the right side bounded across to the left side, and the one that was on the left, to the right; and like two sea-swallows sported they around him. And his courser cast up four sods with his four hoofs like four swallows in the air, now above his head and now below. About him was a four-cornered cloth of purple, and an apple of gold at each corner, and every one of the apples was of the value of a hundred kine. And there was precious gold of the value of three hundred kine upon his shoes and upon his stirrups, from his knee to the tip of his toe. And the blade of grass bent not beneath him, so light was his courser's tread, as he journeyed towards the gate of Arthur's palace"—

this Culhwch is the personal man, you and I, as we know ourselves; to whom, sooner or later, this quest of quests is always ordained, and by whom it must at last be followed.

You see, they were not writing, those Bards, after the fashion of the modern novelists; their wonderful and beautiful tale is simply a myth or allegory of the soul; and shows, to all who can understand, the relation between these bodies of ours, and our minds, and our souls, and that eternal, unseen Spirit which we sometimes call God, the Supreme Self of the universe. All the lofty and mystical incidents were to be taken as glyphs or symbols of facts in the story of human evolution; and because this is so, these stories, though so old, are eternally new and fresh, and always worthy of study. They were the scientific text-books of the ancients; and if we compare them with our own modern text-books, we shall not find them wanting. From anatomy and physiology and biology we can learn a deal about our bodies, but nothing about our very selves; they classify external facts and appearances, but say nothing of the internal and real causes; they are couched in the language of formal thought, and do not at all rouse or inspire the imagination. But the text-books of the ancients speak to the soul and set the imagination flaming. They deal with the world of causes and picture the man himself, not the mere envelope of flesh that he wears; they seize hold upon and uplift our consciousness, and do not merely fill our minds with endless classification of details. Not that one would wish to disparage modern learning; it has its own useful and splendid place; but we ought not to set it up as the be-all and end-all of acquirement; we ought to remember that wisdom is higher than learning. And it was wisdom that the ancients recorded; therefore we have a very great deal indeed to learn from them.

KENNETH MORRIS

THE whole sentiment which the gifted soul has clothed for us in melodious words, which brings melody into hearts, is not this essentially, if we will understand it, of the nature of worship?

It is reverence, it is love towards all Nature that inspires him, that opens his eyes to its beauty, and makes heart and voice eloquent in its praise. There is a true old saying, that "Love furthers knowledge"; but, above all, it is the living essence of that knowledge which makes poets.—*Carlyle*

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question Regarding the subject of Reincarnation a correspondent writes to the Forum: "Here is the great and for me only stumbling-block. Your theory, as I understand it, is, that the soul is not lost, has never been lost from the beginning of ages, but has passed from one body to another endlessly. But have you ever thought this?—that there are so many more bodies now, according to statistics, than there were at the beginning. What does the surplus population do for souls? The original number cannot but have exhausted itself. No matter how many have passed away, there are always more births than deaths. How then?"

P. B. W.

Answer The enormous progress made during the last century in the discovery of the forces of nature, and the rapid extension of certain kinds of knowledge among the people of the Western nations, has at last brought about a crisis in human affairs which bids fair to produce a marvelous change in the ideals which move these peoples in the ordering of their daily life. In these days it is difficult for us to imagine the changes which one short century has brought about. Where should we be if we knew nothing of railways, steam vessels, electric lighting, telegraphs, telephones, etc.? In 1809 all these were waiting on the threshold of discovery.

And if we extend the idea it is surely not wonderful that these discoveries carry in their train a reconstruction of our old-fashioned conceptions of other nations, and of the parts of the globe hardly known a century ago.

And, one step further, we find that the study of these peoples and of the waste places of the earth, has led to discoveries of the utmost value. We have new ideas of religion, of government, of history, of man himself. We find that many of our time-honored and egotistical notions have had to be laid aside, and that the newly acquired knowledge has given us a broader basis of learning, a firmer foothold, a new view-point which is more healthy and more noble. Most important of all, this new basis of thought and ideals coincides most remarkably with those advancing aspirations which our hearts had formulated almost before they had been confirmed by the facts of contemporary literary and archaeological discovery.

And so it is now a matter of common knowledge that two thirds of the people in the world believe in the idea of Reincarnation. Among them this belief has descended all through the ages from the very earliest times. It is part of their life. They do not look upon it as requiring proof or argument. It is taken as a matter of course. Where did it come from? The teachings of Theosophy say that it is part of that natural, essentially divine and yet human religion which is of and for all men—the seeds of truth which lie concealed in the heart of every human being.

If the very natural question is asked, How is it that we in America or Western Europe never heard much of it until recently? the answer is simple. Christianity (along with other religions) is but one offshoot of the primitive Wisdom-Religion. But very early in its history, a millennium and a half ago, this by-product of earlier faiths had become priest-ridden, a prey to ecclesiastical dogma. It was not convenient for the early Christian bishops to hand down to posterity the truth of Reincarnation, although many of their number had

already accepted it and written about it. Their flocks were ignorant, and the glory of Greek culture and learning had passed away. And so at Constantinople, about the beginning of the 6th century, they ruled it out. It did not matter to them that the Nazarene master knew of it and taught it to his disciples. Their power and precedence depended upon human ignorance. And so it does now.

The statement of the question that "there are so many more bodies now according to statistics" does not agree with any known facts. What statistics can we have of the population of the globe, say 2000 years ago? to say nothing of earlier times. That the population of the two Americas is rapidly increasing is of course well known; but nothing certain is known even now of the population of Asia although it is supposed to contain six times the population of North and South America together. Vast numbers of Asiatics are continually perishing by famine and disease, and there is little question that the nations of the East have been gradually diminishing for thousands of years. Take for instance the ancient and powerful kingdom of Persia. Herodotus relates that the army and navy of Xerxes just before the battle of Salamis amounted to 2,317,000 fighting men, together with 2,000,000 slaves in addition! No modern nation could raise such an army.

Again, the modern estimate of the population of Asia as some 900 millions out of the 1500 millions which the globe is supposed to contain, is sufficient to show that about three-fifths of the population of the earth live in a portion of it of which we have no accurate statistics. What we do know however, in a general way, is that whilst the East is diminishing in numbers the West is increasing.

The value of the archaeological discoveries of the last half-century cannot be over-estimated. They support unmistakably the statements of H. P. Blavatsky that vast areas of the globe, now desert, were once densely populated by highly cultivated and civilized nations. There is no reason to suppose that the number of inhabitants has materially diminished or increased for countless ages.

The statement of the Eastern sages that the average term of disembodiment between incarnations is about 1500 years, would show by inference that there must be a vastly greater number of souls taking their rest, than those who are actively engaged in the lessons of earth-life. We have no definite information on this point.

But however this may be, we need to be very careful how we allow our set ideas to dominate our larger view of the question. In its ultimate essence, the soul of humanity is one. Like a shining conscious light, it has countless rays which are now extended, now withdrawn. The temporary manifestation of the individual ray which we call earth-life is an experience which not only affects that ray but all its fellows. In sleep and in death we return to our home. By right knowledge of this we may in waking life see more and more of the truth which shall make us free.

STUDENT

THOSE who are wise in spiritual things grieve neither for the dead nor for the living. I myself never was not, nor thou, nor all the princes of the earth; nor shall we ever hereafter cease to be.—*Bhagavad Gita*

THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l O f f i c e P o i n t L o m a C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

A Clergyman on Karma and Reincarnation

FOLLOWING are some remarks on the Theosophical doctrines of Karma and Reincarnation, made by an Episcopal Rector, according to a newspaper report of his sermon. One might begin by saying that if the function of the pulpit is to deliver dogmatic and arbitrary assertions, then perhaps one ought not to subject the rector's statements to the cruel test of logic, which surely they were never meant to stand. Still, they may be used as the basis for some remarks on these two Theosophical teachings.

The first statement to be quoted is:

If Reincarnation is true, then the scientific law of heredity is false.

Here we find dogmatism running for shelter behind the shield of its hereditary foe, science; putting on the armor of Achilles, as it were, in order to make itself appear terrible to its other foeman, Theosophy. Probably science can afford to smile indulgently; there is plenty of room under its skirts. One may trust that the lesson of this rector's argument will not be thrown away on the public. For observe, dogmatism, when confronted by Theosophy, now no longer relies on its own weapons, but borrows the implements of war—and that from its own sworn foes!—the very foes, too, who have done so much to destroy its own defenses. At this rate, what may we expect? A church with a statue of Darwin in place of the Virgin? a laboratory bench for an altar, surmounted by Avogadro's hypothesis and the law of conservation of energy on the walls where the ten commandments are usually seen? Some day when Theosophists are calling in question some scientific dogma, they may expect to hear something like the following:

Professor Thomson, at the British Association, said that the Theosophical teachings about the origin of man must be wrong because they contradict the Church teachings about the Creation.

But it will not do; Science is *our* ally. We find nothing in the scientific knowledge about heredity that conflicts with Karma and Reincarnation. What is the scientific law of heredity? How would the clergyman define it? So far as one can make out, it amounts to a statement of the fact that certain qualities of children are derived from their parentage. With regard to the law or process which de-

MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

termines in what degree and proportion the child shall inherit those qualities, the attitude of science is agnostic and non-committal; it simply does not know. So what is it, after all, that the Theosophical teachings are supposed to confute? Theosophy does not deny that many of the lower qualities of children are received from their parents. It admits this, and any further views which Theosophists may hold on the subject do not contradict anything that science holds (for science holds no definite views at all), but merely supplement them. Science does not know what determines heredity; it merely knows the fact of heredity. Theosophy supplies explanations.

Theosophy states that *the kind and degree of the attributes which a child receives from its parents are determined by the needs and demands of the incarnating Ego*. If two children, born of the same parentage, inherit totally different characters, Science has no certain explanation of the fact; but the Theosophical tenet declares that we must search further and attribute that difference to the difference *between the characters and destinies of the incarnating Egos*. So there is nothing in the Theosophical doctrines of Karma and Reincarnation to confute any knowledge which science possesses, but contrariwise; and we may inform this clergyman that scientific men show a marked leaning towards Theosophical views on many questions. The weapons which the Church would fain borrow from science are those which science has already very nearly discarded; and no doubt the church is welcome to the rusty blunderbuss, and no one will attend very seriously to it as it stands in its pulpit and cries, "Look at my new armor and tremble!"

The next assertion to be dealt with is:

If Karma is true, then the philosophy of remedial and educational suffering is false.

One surmises that the clergyman means that if suffering is deserved, then it cannot be remedial and educational. Surely such an opinion needs no comment. One would have supposed

that deserved suffering would be more remedial than undeserved suffering. The theological doctrine here had in mind is evidently that which states that the Deity inflicts suffering upon us in order to educate us. Theosophists need merely point out that *the great bulk of human suffering is caused by human beings themselves*—a view that no

sensible person will controvert; and its doctrine of Reincarnation enables it to show in what way much of this just suffering, whose origin cannot be explained by science or theology, originated. Some of our sufferings are due to things we have done in this life; that is obvious, and no theological dogma can upset that. *Other sufferings are due to things we did in past lives*. But how do these facts conflict with the principle that suffering is remedial? Every sane person knows that suffering is remedial, however caused. Of course the attempt is to show that if a man believes his suffering to have been caused by his own actions in a past life, he will thereupon cease to learn anything from that suffering! In answer to this contention one can only beg to differ and pass on.

The next assertion is more sportsmanlike, for the church uses its own weapons:

If both Reincarnation and Karma are true, then the Christ was deluded, his teachings are a lie, his life a mistake, his sacrifice folly, and Christianity the world's greatest farce. For he taught the fact that it is appointed unto man once to die, and after that the judgment—not Reincarnation.

Theosophists would be sorry to think that their teachings were such a menace to Christ and Christianity. The clergyman is exaggerating the danger. And he is taking too great a risk in thus putting every single one of his eggs into the same basket. This policy of "all or nothing" does not seem to commend itself to the more cautious of his brethren, some of whom prefer to take the line that even if Karma and Reincarnation are true, still Christianity has naught to fear.

Did Jesus really teach anything inconsistent with Karma and Reincarnation? We know that he said: "With what judgment ye judge, ye shall be judged; and with what measure ye mete, it shall be measured to you again." This is Simon-pure Karma. And Paul states the same eternal law:

Be not deceived; God is not mocked; for whatsoever a man soweth, that shall he also reap.

(CONCLUDED ON PAGE 11)

THE THEOSOPHICAL ADDRESS AT ISIS THEATER

IT was with great interest that the audience at Isis Theater listened last night to Mrs. Marjorie M. Tyberg's first lecture on "The Web of Destiny." The lecturer, who is a student at the International Headquarters of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, and one of the teachers of the Râja Yoga Academy at Point Loma, has made a deep study of the subject, and held the interest of the listeners throughout. Following are extracts from the lecture:

"The Past and the Future! At every moment of our lives we stand between these two, linked to the one by what we are, by all the conditions surrounding us, for in the past we were building these; linked to the future by every breath, for with every breath, by thought and deed we sow the seeds of the character and outward circumstances of future lives. Only too often the sole work that is being done by men and women in building the future is in weaving nets for their feet, in which they shall stumble and grope and fear and fall, until at last a light breaks upon them. Then they learn that the web of destiny is of their own weaving; that none can extricate them but themselves, and that in courageously facing all the causes sown in the past, causes sown in ignorance and also in defiance, and untying the knots of destiny, liberating themselves from the coils woven around them by selfish living, they may at last realize the high destiny of a human being and win the consciousness and beneficent power of the godlike nature, which waits and is crucified, until this great awakening of the Soul takes place in the human being. Man is conqueror of the Past, master of the Future, when he knows his own divinity, as Theosophy can teach it to him. . . .

"All mature men and women, all, in fact, who can look back over twenty-five or thirty years, must, if they reflect at all, realize that there is in human lives a peculiar significance, a mysterious relation, between individuals and the events of their lives. Sometimes, it is true, the element of the unexpected is so strikingly introduced that at first consideration there seems to be no connexion between the person and the event in his life which gives to it all a sudden turn; but when we note the way in which he reveals himself in relation to new and, to us and to him often, most unexpected conditions, we are obliged to conclude that there was a fitness there, either to yield or to endure; a strange harmony, as if the inevitable, guided by powerful, unseen hands, had brought home an effect to the source whence emanated the cause. Have you ever known people to recognize this? to exclaim, when sudden disgrace or misfortune, ruining their hopes and their homes comes upon them: 'At last it has come; my hidden dread was not a fancy. Now for the strength to bear what all along I have known was coming to me!' . . .

Too long have men in ignorance and the slavery to selfish desire woven fetters for themselves. Little by little, enlightened by Theosophy and guided by its Teachers, even as of old, shall they now learn to be Builders of a glorious future in which the Soul, with all the passions, its transformed and devoted servitors, shall be free to express in human life all the beauty and harmony that can never be lived until the Law is known and obeyed."—San Diego Union

A Clergyman on Karma and Reincarnation

(Concluded from Page 10)

As for Reincarnation, Jesus nowhere denies it, nor are his teachings inconsistent with it; while in more than one place he certainly seems to assume it as being a recognized teaching—in the case, for instance, when he was asked whether the man was born blind for his *own* sins or those of *his parents*. It is

now admitted, even by many clergy, that the ecclesiastical doctrines of heaven and hell cannot be based on these gospels; and that the teachings therein have been *misinterpreted to suit ecclesiastical ideas, in some places words and passages having been added to the text*. In *Matthew* xxiv, the words "What shall be the sign of thy coming and of the end of the world?" have been changed in the Revised Version to, "What shall be the sign of thy presence and the consummation of the age?" as being the original Greek. The word "everlasting," used in the phrase "everlasting life," is the Greek *aionion*, the meaning of which is debated, but which certainly does not mean everlasting, and has been changed by the revisers into "eternal." In the last chapter of *Mark* are ten verses which contain much upon which church dogma has been founded. Among this is the following:

And he said unto them, Go ye into all the world and preach the Gospel to every creature. He that believeth and is baptized shall be saved; but he that believeth not shall be damned.

In the margin of the Revised Version it says:

The two oldest Greek manuscripts, and some other authorities, omit from verse 9 to the end. Some other authorities have a different ending to the Gospel.

Clearly, then, this is one of the places where additions have been made to Jesus' accepted teachings. There is nothing in Jesus' teachings contrary to Karma and Reincarnation; it is only the ecclesiastical glosses and dogmas that conflict therewith. Such sayings as: "Ye shall know the truth, and the truth shall make you free"; "Be ye perfect, even as your Father which is in Heaven is perfect"; indicate that Jesus the Christ was favorable to that Self-Knowledge which Theosophy so insists on, and that he regarded it as the road to salvation. It is the churches, not Jesus, who have invented another road to salvation—the road of dogmatic belief. And such sayings as "Whosoever committeth sin is the servant of sin. And the servant abideth not in the house for ever but the Son abideth ever. If the Son therefore shall make you free, ye shall be free indeed"; and, "Except a man be born of water and of the Spirit, he cannot enter into the kingdom of God"; are direct allusions to such doctrines as Theosophy teaches.

As to Jesus' sacrifice, it is impracticable here to go at length into the question of vicarious atonement—that has been done elsewhere in Theosophical writings—but it may briefly be said that the doctrine as taught by the churches is church-made. The original teaching is that man's savior is his divine nature, the immortal Ego, which sacrifices itself by entering into the flesh, in order to redeem the lower nature and make the perfect man. Jesus is always urging men to trust in this divine nature. But the churches have transformed this sublime teaching into the dogma that man is saved, not by the power of his own inner divinity (as Jesus taught), but by professing his belief in a vicarious sacrifice made by Jesus. By this doctrine the independence of man is taken away and he is made to rely upon the church; he is made to believe that he is born in sin and can only obtain pardon by faith in this teaching. This kind of religious teaching is found in all religions in the period of their decline; it is a priests' religion. Many Theosophists desire to combat this ecclesiasticism and to restore the original teachings of Jesus. There is much in ecclesiastical teaching in conflict with Theosophy, but none in Jesus' teachings.

Misquotes Bible

But if it be thought that a man unacquainted with the subject he ventures to attack is not qualified to attack it, what shall be thought of

one who is unacquainted with his own subject also? Even a Theosophist is loth that the Christian Bible should be misquoted and words put into the mouth of Jesus which he never uttered. It is for this reason that we venture to point out that the words, "It is appointed unto man once to die, etc.," attributed by the preacher to Jesus, *were written by the author of the Epistle to the Hebrews*, ix, 27. Perhaps this gentleman will now understand better how the text of the Bible has become so corrupted throughout the centuries. It is just this sort of carelessness—to call it by no worse a name—that is responsible for so many of the errors which Theosophists, as upholders of the truth, feel themselves bound to point out. Really it is scarcely worth while breaking a lance with an opponent who can only support his alleged Master by putting into his mouth words which he cannot prove he said.

Next is an absurd travesty of Theosophical teachings, about which one can only say that it is an utter misrepresentation and that he may be left to demolish his own man of straw. Those who wish to know what the Theosophical teachings are, can find out for themselves; the mentally lazy would have no use for Theosophy, nor Theosophy for them, probably. But finally, the gentleman has this:

Our theory of the sweet innocence of childhood is only fiction [if Theosophy be true]. For the returning souls, soiled and travel-stained by many former lives, cannot be as innocent and pure as we believe our babies to be at the hour of birth.

Here the clergyman suddenly abandons all he has just maintained about heredity; for his contention was that children inherit the traits of the parents; how then can they be innocent and pure at the hour of birth? Such a procedure is sufficient refutation of his whole case.

But we know perfectly well that however innocent and pure may be the innate divine Spark, babies carry with them into the world the seeds of both evil and good, which begin to sprout on the first opportunity; and no amount of ecclesiastical doctrine can alter that fact. It may be very pleasant and pretty to believe in the "sweet innocence of childhood"; but the practical man has to face facts, not blink his eyes to them. And the fact here is that be the case as to heredity what it may, our children come to us endowed with potentialities of all sorts, with which we have to deal. We may encourage the evil or the good; great is the responsibility of parents for they can preserve the purity. Here, especially, does the virtue of Theosophical teaching, as opposed to ecclesiasticism, come out; man will never reach any level of attainment *unless he makes up his mind to exert himself and use his own God-like powers*. If he is always to be relying on "grace" and praying for forgiveness, the powers of evil will infallibly do what they like with him. Let him recognize the facts of life and grapple with them, and not fool himself with pleasant theories as an excuse for neglecting his duty. STUDENT

Thoughts about the Earth's Rotation etc.

THERE was a beautiful and suggestive experiment made by Ampère, the significance of which in connexion with the rotation of the earth may be considerable. A magnet, loaded with platinum at the lower end, floats upright in mercury contained in a circular glass vessel, at some distance from its center. On dipping a point, connected with one of the terminals of a battery, in the center of the mercurial surface, the other terminal being connected with the outer edge of the mercury, the magnet is seen to rotate on

its axis. Here is a perfect analogy to the sun, considered as a radiator of electric forces, and the earth, considered as a magnetized body. We discern the possible cause of rotation of all celestial bodies, a problem which, equally with the cause or true nature of gravitation, has been the crux of astronomy.

The motions of the earth and their causes are, however, more complex than the unintelligent play of even several sets of electro-magnetic forces would explain. Especially when we consider that these motions will be found to include some not yet known to, or at all events admitted by, science. For, while Professor See has just proved mathematically (as H. P. Blavatsky indicated would soon happen) that the sun did not eject the earth, nor the earth the moon—from the application of Babinet's principle that the moment of momentum of a rotating mass is constant, whatever space that mass may occupy—it nevertheless does not follow that because retrograde motion may have been produced by some satellites crossing their own path during capture, *therefore* no planets or satellites have been inverted.

Such reasoning affords an instance of the natural, yet not always wise, tendency to generalize from a single line of data upon phenomena which include other lines known to other branches of science. The recognition of life in all things is beginning to invade the domains of chemistry and crystallography, etc. That of consciousness in all, to invade those of biology, etc. And is the grand science of astronomy to plod along on the old lines—a universe of dead matter and empty space, controlled by but one law, which is not even a law but only a mathematical theory—while the forces of electricity, magnetism, life, will, intelligence, are to be held as having no part to play among the heavenly motions?

Motion may be said to be the legitimate sphere of astronomy; although astro-physics may include everything up to the conscious regents of the heavenly bodies, if it can soar so far. Yet the pure problems of motion should scarcely exclude the phenomena presented by electro-magnetic action—putting aside the more recondite forces by means of which Intelligence and Will act through Vital Electricity.

In order to show how easy it should be to bring electricity and magnetism into the domain of celestial movements, it has long been known that force-phenomena can be expressed in identical symbols in terms of (a) linear, (b) rotatory, or (c) electro-magnetic action; which ought surely to encourage astronomers to look more closely into this matter. As thus—

(a) (b) (c) Time :	=	t
(a) Distance : (b) angle : (c) quantity :	=	q
(a) Linear velocity : (b) angular velocity :	=	$\frac{dq}{dt}$
(c) current :	=	v
(a) Linear acceleration : (b) angular ditto :	=	$\frac{d^2q}{dt^2}$
(c) current ditto :	=	$\frac{dv}{dt}$
(a) Mass : (b) moment of inertia : (c) coefficient of self-induction :	=	m
(a) Momentum : (b) angular momentum :	=	mv
(c) electro-magnetic momentum :	=	
(a) (b) Frictional resistance : (c) ohmic resistance :	=	r
(a) Force, to overcome resistance : (b) torque, ditto : (c) electro-motive force, ditto :	=	rv
(a) (b) (c) Energy in overcoming resistance in time dt :	=	rv^2dt

(a) Force to overcome inertia : (b) torque, ditto : (c) electro-motive force to overcome self-induction :	=	$m \frac{dv}{dt}$
(a) (b) (c) Energy acquired in time dt :	=	$mv \frac{dv}{dt} dt$
(a) (b) Kinetic energy : (c) energy of magnetic fluid :	=	$\frac{1}{2}mv^2$
(a) Total force applied : (b) total torque : (c) total electro-motive force :	=	$rv + m \frac{dv}{dt}$
(a) (b) (c) Total energy in time dt :	=	$rv^2dt + mv \frac{dv}{dt} dt$

And so on. It should be at once evident that the recognition of electro-magnetic action tends to complete the imperfect theory of attraction in an important respect, by making its action dual instead of one-sided; that is, simply, both attraction and repulsion are involved in all celestial phenomena, beginning with mere rotation, as is illustrated in Ampère's experiment.

As H. P. Blavatsky's work, *The Secret Doctrine*, contains more real hints for research to work out than any other book in a European language, no apology is needed for introducing a few quotations bearing on our immediate topic. Written in 1888, the following has since been corroborated by the march of discovery:

The so-called Forces of Nature, Electricity, Magnetism, Light, Heat, etc., etc., far from being modes of motion of material particles, are *in esse*, i. e., in their ultimate constitution, the differentiated aspects of that Universal Motion . . . (vol. I, 147).

There are many grades and orders both of matter and force, mostly subtler than those yet recognized; while Fohat, an ancient term for the *electric* forces (which has the advantage of connoting their action with life and intelligence, without being one whit less scientific), has many subdivisions.

"The abodes of Fohat are many," it is said. "He places his four fiery (electro-positive) Sons in the 'Four circles'; these *Circles* are the Equator, the Ecliptic, and the two parallels of declination, or the tropics. . . . Other seven (sons) are commissioned to preside over the . . . *lokas* . . . at the two ends of the Egg of Matter (our Earth and its poles). . . . 'The agitation of the *Fohatic* Forces at the two *cr'd* ends (North and South Poles) of the Earth which resulted in a multicolored radiance at night, have in them several of the properties of *Ākāśa* (Ether), *color* and sound as well.' . . . The two poles are said to be the storehouses, the receptacles and liberators, at the same time, of Cosmic and terrestrial Vitality (Electricity); from the surplus of which the Earth, had it not been for these two natural 'safety-valves,' would have been rent to pieces long ago. (vol. I, 204-5)

The analogy with Ampère's experiment is obvious, remembering the Sun as a radiating center of one order of forces.

Besides its annual revolution, the Earth has three distinct movements, rotation, precession, and inversion—the latter phenomenon as yet unrecognized by science. That of precession, has been attributed to the shape of the earth, but while there happens to be an apparent correspondence with theory, it may be found that this is more accidental, as it were, than efficient. For the theories respecting oblateness will not bear examination when applied to other bodies in the solar system (see *The Secret Doctrine*, vol. I, 593).

A thermo-electric torque with a resolved axial component in the plane of the ecliptic, would account for the phenomenon of precessional movement. It would be nil at the equinoxes, as under the hitherto accepted theory.

Every sidereal (great) year the tropics recede from the pole *four degrees* in each revolution from the equinoctial points, as the equator rounds through the Zodiacal constellations. (*The Secret Doctrine*, vol. II, 331)

This phenomenon (of inversion) can be seen to be in progress from a glance at comparatively modern records.

Three thousand years ago, states Laplace, the obliquity of the ecliptic observed by Tchou-Kong, from the solstitial shadows at Loyang, in China, was $23^\circ 54'$. Applying the foregoing rule, the recession up to now should be $0^\circ 27'$, making the actual obliquity, $23^\circ 27'$.

An electro-magnetic torque (probably generated by the circles of Fohat in conjunction with solar radiation) only one-ninetieth of that causing precession, with a resolved axial component perpendicular to the plane of the ecliptic, would account for this slow phenomenon of inversion. This phenomenon, as well as the precessional movement, can be well shown by a properly constructed gyroscope.

It should be noted that all three, rotation, precession and inversion—assuming a subtle resisting medium to be overcome by something in order to ensure steady rotation—are reactions with external forces. There must be a link. Tidal friction, it is true, results from reaction to external force, but it will be clear from what follows, that reasonings from this *effect*, like other reasonings connected with oblateness, have been made to fit facts imperfectly known; and tidal friction does not belong to the domain of *verae causae*, in the general sense. If it did, the obliquity would be increasing, not diminishing.

For all three phenomena are under intelligent control—the latter (inversion) taking place *rapidly* at certain cyclic periods in *response to forces* generated by the Karma of the Earth and its inhabitants; and then—cataclysms occur. The last of these was connected with the destruction of the continental systems which formed the home of the Fourth, or "Atlantean" Root-Race of this Round. There were previous inversions.

As some doubts have been expressed whether the changes in the direction of the Poles referred to in *The Secret Doctrine* may not imply a *geographical* change—it is only necessary to point out that this kind of change, say through an arc of 60° , would entail the introduction into the Earth of a force with a moment of momentum equal to that now existing. Though the Earth, by precession and inversion, tilts, at one period or another, *in every direction*, the North Pole stays, geographically, where it is.

It is interesting to find that, simultaneously with Professor See's denial of inversion, Professor H. H. Turner has sought to prove it, ascribing it to tidal influence. The latter scientist, however, seems to have been unaware of the manner in which the former has overturned the well-known Laplace theory of world-formation. (But why should astronomers not read *The Secret Doctrine*?)

Electric forces pervade everything; and the Sun is the store-house of Vital Force, which is the *Noumenon* of Electricity; and it is from its mysterious, never-to-be-fathomed depths, that issue those life-currents which thrill through Space, as through the organisms of every living thing on Earth. (vol. I, 531)

Vital Force, the noumenon of Electricity, is the vehicle of Will and Intelligence.

FRED. J. DICK, M. Inst. C. E.

Art Music Literature and the Drama

In the Studio of William Keith

A NOTABLE event was the last exhibition by the San Francisco Art Association of the paintings of William Keith, for so long a distinctive and important figure in the California art world. An eastern critic compared Keith's landscapes with those of Turner and Claude Lorraine and his mastery of color with that of Diaz de la Peña. But what rendered the exhibition especially notable was the fact that all of the paintings in it had been done since the San Francisco fire and by a man who, at the time of the earthquake which plunged the city into darkness and then flame, had nearly compassed the allotted "three score years and ten."

On that memorable eighteenth of April in 1906, William Keith saw a wall of fire about the big Pine Street studio which contained all the unsold canvases that had been accumulated during a lifetime of study. Nearly two thousand paintings were burned, and yet, only three years later, this remarkable artist, at an age when most men are thinking only of slippers and the easy chair, furnishes forth a large exhibition with work done since the fire. The opening of it occurred on his seventieth birthday and was made, in addition, the occasion of a warm personal tribute to the artist by his friends, who declared that his work had ripened into an unwonted strength and beauty since the catastrophe.

William Keith was born in Scotland, and, early coming to America, began life here as a wood-engraver for *Harper's Weekly*. When, some years later, he came to California he took up painting and later went to Europe for study. After that came years spent with Nature, much of the time in the Sierras and often in the companionship of his life-long friend John Muir, who is known all over the world as a naturalist. From these outings he would bring home innumerable sketches and his studio witnessed the translating of these into the paintings that made William Keith so notable a figure among contemporary landscapists. George Inness, than whom America boasts no greater landscapist, certainly none of his own generation, painted with Mr. Keith while in California, and expressed high regard for the latter's work.

But it is not only in landscape that Mr. Keith has won an enviable place. Rembrandt and Velásquez were as carefully studied during his European tours as Corot and Claude Lorraine, and he has done important work in portraiture.

William Keith is more than a painter, he is an artist, bringing to his work something finer and deeper than mere technique. A past master of technical processes, he yet looks deeper because he lives deeper, and in many

of his paintings there is a mystical touch that fairly glorifies the canvas. His works are more than translatives of Nature's beauty and mystery, they are creative interpretations. Yet they may be broadly classed in two groups: those which are painted with great fidelity to the outer aspect, and those in which, as one writer says, "he allows his poetic fancy to glorify the scene and leave it a haunting mystery." Yet neither group skirts the danger-point of the extreme. Both are full, rich expressions of technique mastered and sublimated by a spiritual ideal, although this in

Lomaland Photo. and Engraving Dept.

WILLIAM KEITH
THE NOTED CALIFORNIA ARTIST

varying degrees, begotten as they are of many moods and occasions and intended for divers purposes.

A morning full of interest and inspiration was spent by a Lomaland Student recently in the studio of William Keith. The whole environment suggested much more of the richer, truer things of life than does the average studio; and it could not be otherwise, for the artist himself is a compassionate lover of all that breathes, a devotee of Nature, not a mere user of her *largesse*, a man who would have made his mark with ease in literature or philosophy. He sees life in the sunrise light of the poet's vision, and today, the snows of seventy winters upon his noble head, he looks out over the horizon with the joy and freshness of a youth. A LOMALAND STUDENT

The Viola

BERLIOZ, whose knowledge of the capacities of orchestral instruments is yet the envy and the despair of the modern composer, says in his well-known treatise on instrumentation:

It (the viola) has, nevertheless, been long neglected, or put to a use as unimportant as ineffectual—that of merely doubling in octave the upper part of the bass. There are many causes that have operated to produce the unjust servitude of this noble instrument. In the first place, the majority of the composers of the last century, rarely writing in four real parts, scarcely knew what to do with it; and when they did not readily find some filling-up notes in the chords for it to do, they hastily wrote the fatal "col basso"—sometimes with so much inattention that it produced a doubling in the octave of the basses, irreconcilable either with the harmony or the melody or with both one and the other. Moreover, it was unfortunately impossible at that time to write anything for the violas of a prominent character, requiring even ordinary skill in execution. Viola-players were always taken from among the refuse of violinists. When a musician found himself incapable of creditably filling the place of violinist, he took refuge among the violas.

The above was, of course, written some years ago; yet it still applies more generally than should be the case with this weirdly beautiful instrument. Berlioz himself selected it as representative of the voice of lonely and distraught Childe Harold, which none other could possibly have suggested so well. Mellow, pathetic, indescribably tender, again gloomy with suppressed foreboding; now the very voice of fortitude, of that inner quiet joy begotten of self-control; and again, sweet and even lightsome. Yet let it not be affronted and tortured into uttering extravagances suitable only for the violin. It has a quality, a psychological effect, a Soul, if you please, of its own, and that, once recognized, will point unerringly to that gateway through which player and composer must enter ere the secret of its mystic beauty be discovered or revealed.

The great composers have recognized this. Study the *partitur* of Beethoven's piano concerto in E flat (the "Emperor"), in the orchestral score of which the violins are muted while the violas sing out in their own natural, clear, mysteriously effective alto tones. Wagner's use of this instrument is known to every student of his scores, and year by year, as the younger school of composers strides on and ahead, the viola is being more and more widely recognized as an instrument of dignity, real beauty and power. It can never hope to rival the violin as a medium for the display of technical skill on certain lines, but in its own stately dignified loveliness of character it can be, in a very real sense, interpretive of that Soul of Beauty of which it certainly is a long-neglected expression. In Lomaland the viola occupies a distinctive place. STUDENT

Then the mind becomes deflected toward discrimination and bowed down before Isolation.

Patanjali

WHEN the mind allows itself to be run by a false idea it is in much the same situation as the body when dominated by some bacillus of a malignant type — both are hopeless of getting out of the wrong path and on the right without the leverage of sad experience. And, to suggest a further analogy, the bodily ailment which, bitter as it is to bear, yet acts as a lever and a clearance, is not a particle more entitled to the name "disease" than the mental bias of one whose mind is under the control of some misconception.

At the present time school teachers all over the world are beginning to sigh with relief. The first strenuous weeks after vacation are over, a certain proportion of the harm that long vacations always do to the average pupil has been counterbalanced and the prospect of being able to begin once more where the work was left off at the close of the preceding school-year is a pleasant one.

It is a point no longer argued by educators, nor by thinking parents, the folly of the average long vacation and the actual drawback it usually is in many vital ways. There is some gain, to be sure, but of a kind that would not need to be considered were the school curriculum adapted to the actual and all-round needs of the pupil, needs mental, physical, and spiritual.

Nor is the child the only sufferer from the vacation idea. The society matron comes back from Europe or the mountains as restless and often as tired as when she went away, while many a sweet young girl returns from an ill-advised summer vacation with something fresh and pure and true gone out of her young life, not to return, if indeed it ever does, until sorrowful experiences have crushed her to the very earth and aroused whatever latent soul-strength there may be in her.

And so it goes. The few who really profit by their vacation-times are the exceptions that prove the rule. They are of the rare type

THE REAL VACATION

THE LAST SONG

(Translated from the German)

A SONG of my creating,
A wondrous song I'd sing,
Which like the fragrant breeze of May
O'er earth its flight would wing.
From North to South, from East to West,
Away break in a trice,
And give to all mankind sweet rest,
Joy, Peace and Paradise.

Unto the sick and dying
Sweet cordial it should bring,
The sound of its soft pinion's stroke
Still grief and suffering.
Mid clank of arms and conflict hot
Fan courage to a flame;
For woe men comprehended not
Comfort it should proclaim.

But where'er sin is lurking
With cruel serpent e'e,
To hurricane swiftly rising,
Twill sweep it in the sea.
In every chink in house of pain
A cooling balm distill,
The temple cleanse from ev'ry stain
And every want fulfill.

And if this song succeeded,
Nor fame nor gold to gain
I'd wish, but throw my lyre down
And sing no other strain.
Unto the pine woods stealing,
Lay me down for death's repose
To no one e'er revealing
Who did this song compose.

Johanna Ambrosius — Selected

that is not led by the personal motive nor run by the personal idea.

Yet there must be change for tired body and over-wrought brain, rest, vacations if you please. "The string o'er-stretched breaks" and very few are so constituted that monotony of whatever sort does not become monotonous

in time. Our insane asylums harbor a legion of women from isolated Western farms, sheep-herders from lonely mountain ranges, inmates from penitentiaries in which idleness is inevitable because work is not provided — "Causes: monotony, . . ." is part of the record against their names. A change, some kind of vacation from the deadening strain, would have saved them, or postponed the disaster, at least. But what kind of vacation? A ceaseless whirl of activity has wrecked as many minds as monotony.

As a matter of fact history abounds in instances of those who have become strong in soul-strength in spite of the most wearying monotony in their environment. What average, selfish, restless mortals accept as a goad to drive them, like driven sheep, to misery, even perdition, stronger souls use as helps, open gateways, opportunities. Prison was a gateway to John Bunyan. Except for that period of enforced quiet which preceded his incarceration in the Luxembourg, we should not have had that wonderful, that compassionate effort of Thomas Paine to "lift the French nation out of the atheism it was falling into." Thoreau, pegging shoes in Concord jail, found leisure to summon philosophy to its task in behalf of a needy generation. Elizabeth Tudor, virtually imprisoned for several years during her girlhood and suffering the additional torture that calumny has the power to inflict, studied, read Plato, lived with the sages, and builded, builded. What many another would have chafed under as injustice, wasting precious years in idleness or discontent, the girl Elizabeth used in ways that marvelously prepared her for right guidance of a nation, later.

Eighteen years of imprisonment aroused in Mary Stuart latent qualities that made her defense in Fotheringay, during that memorable October in 1586, "a masterpiece throughout of indomitable ingenuity, of delicate and steadfast courage, of womanly dignity and genius." a defense conducted alone, without a single

counsellor, and against the shrewdest legal minds of the day; and that made her death heroic, sublime in its simple trust.

Josephine!—what prison walls ever limited and confined as did the iron fate that closed in upon Josephine's heart-life and tied her hands just when the French nation most needed what she alone could have given, what she had been patiently waiting to give? What must have been the wearisome monotony of Susannah Wesley's life—a gifted woman who might have won an independent place in literature. But she was a mother of nineteen children, and obliged to give them not only the ordinary mother's due, but book-education as well, for the father was a poor curate, "occupied with his parish," there were no schools and no money to pay teachers. For twenty years Susannah Wesley, often in delicate health and never strong, maintained a school in her home and drilled her children in their studies. There was no vacation for her until the time came for the long one. There is no record of her ever demanding one. Yet, interiorly, how she *grew*! Evidently she had not the modern disease of unrest, while she did have a saint's devotion to duty and a philosopher's conception of what it was made of.

No vacations entered into the life of Johanna Ambrosius, until very recently, now that her life is nearing its sunset time; and a harder, more monotonous, confined and heart-breaking existence than this woman, this gifted poetess, lived for decades, could hardly be imagined. Hunger, pain, ill-health, grief and loss, anxiety, the most cramping poverty—every discouragement that the indomitable Warrior-soul perchance might have dared to challenge at that sacred moment of re-consecration, renunciation, and choice which we know precedes the taking up of old burdens—all these were hers. Yet she grew strong in soul-strength during year after year.

The list might be extended to include nearly all of those who used monotony and the so-called deadening, cramping, harsh conditions which physicians still name as "causes" of melancholia and other forms of insanity, —not to mention suicide—as means and opportunities. Milton's and Homer's blindness, Beethoven's deafness, Dante's exile, Joan of Arc's quiet, monotonous task of tending sheep—are these not prison walls, and is it not probable that every confined soul at times, even the most philosophic, longs to break the bonds and untie helpless hands, and breathe and taste freedom, freedom to help and serve?

But the strong soul knows that what seems the unbearable, the unendurable—for to feel one's hands tied when the world is calling for help and hope, and the heart is bleeding to give it *is* unbearable—may be used as hewn stones are used by the builder. And such as these clasp the iron-gloved hand of crushing, monotonous, dispiriting conditions, to be lifted by it—for is it not the hand of Karma, after all?—to heights of peace and actual stored power.

The secret is that such as these have not the modern vacation-fever in their blood, while they do have in their hearts the power to create and have and hold the *real* vacation, which is a vacation from bondage to desires. That is the golden key. Merely to move from place

to place will accomplish nothing for the real self. To fly, now here, now there, simply because we have come to dislike the place we fly from, or because we have not the courage to fight out the battles begun there, is playing draughts with Satan. First it is his move, then it is yours; and when all is over, you have the experience, and—he has won.

There is no vacation in the world like the kind that enjoyably offers itself as the guerdon of self-conquest. We need no bank account, nor a month's planning ahead; and our rest will be all untroubled by thoughts of its early close. To be released from the prison of some evil habit, to be freed from the tyranny of some delusion that out-Herods Herod himself in its power, to be able actually to take a vacation from the monotony of selfish thinking, to shut down for all time (unless we are so fool-

jealousies, and other delusions are all the self they are conscious of—what have we gained?

While there can be no question that in many cases a complete change of work or scene or both will often prevent threatened insanity, possibly moral failure or physical breakdown, those who need, or selfishly demand, this extraneous help are not yet of the company of "those strong souls which wait upon the gods." Someday the battle which now they flee from, fearing that to challenge it squarely would mean failure, or else not understanding their own natures and so honestly believing that outward change will force an inward clearance, which it never can of itself alone—someday this battle will have to be faced and fought, and selfishness will have to be boldly ordered from the path. Vacation follows effort in the soul's realm as door after door is unbarred. H.

Lomaland Photo. and Engraving Dept.

AUGUSTINE'S BRIDGE, BRISTOL

ish as to be later pulled back by the flesh-pots of some modern Egypt) upon our dislike of this or that duty—was ever a vacation known that could compare with such as this?

The unrest of the present age has its wicked clutch upon all who have not the courage, the knowledge, and the power to free themselves and find that Kingdom of Heaven which Jesus so plainly taught *is within*. That is the crux of the matter. We need not wait for death to release us, nor even for the next July. The power lies within each soul to unbar the Gates of Gold through which alone he may pass to the real rest, the real change, which is inner peace.

The Theosophist knows that his only concern is to seek and find the real vacation. The other kind will take care of itself. Nor would he accept the other kind on any terms, if he had to take along the load of morbid, tyrannous, sickening desires and fears that most of humanity carry quite as a matter of course.

We may go to a new place, but if we carry ourselves with us—and with most people their likes and dislikes, desires, caprices, passions,

Jottings and Doings

(From a Student's Note Book)

AN interesting sidelight upon the sphere of "woman's work" is the announcement that Mlle. Maria Ruthowska will shortly enter upon her practice as a barrister in Lucerne, Switzerland. Mlle. Ruthowska, five years ago, was the leading *danseuse* in the Imperial Ballet, St. Petersburg, and *persona grata* and friend to the Czarina herself. The Imperial Ballet is maintained by the Russian government and dances at stated intervals before the Czar's Court. Mlle. Ruthowska resigned her position to study law, entering upon her work at Zurich, and in spite of a flood of hardships, obstacles, and discouragements, she persisted, to win the final honor of standing, after the examination, at the head of her class.

THE Kaiserin is devoting herself to the task of diminishing infant mortality in Germany. She has provided maternity hospitals, also special instruction for young mothers and has offered prizes for the best caretaking of infants. Surely life holds no nobler work than that based on a deep unselfish love for humankind.

OUR YOUNG FOLK

Lomaland Photo. and Engraving Dept.

A YOUNG GROVE OF EUCALYPTUS TREES IN THE POINT LOMA RAJA YOGA FORESTRY TRACT

Lomaland Forestry

THE study and practical work of forestry is given special attention in Lomaland, and a large tract of land is set apart for this important industry.

The boys you see in the picture are a group of Râja Yogas who are studying practical forestry and gardening in this department, under the supervision of a former member of the United States Forestry Service.

This picture gives you a view of the youngest grove of Eucalyptus trees, of which there are three large groves already thriving. Over to the left, out of sight, are the other two groves, one of them having quite large trees. The boys are engaged in cultivating the ground around the roots of the trees, and in cutting out the weeds. Although Eucalyptus trees are quite hardy, they will grow much better if cared for. They grow very rapidly, and it is said will attain to gigantic size in time.

Do you know where Eucalyptus trees first came from? Australia. In that country there are over five hundred varieties of this beautiful tree. In Lomaland several varieties are already planted, including some with bright red blossoms, and also the "Lemon-scented," whose leaves have a delicious fragrance. Some of the trees have the large coarse leaves which we are accustomed to see, while others have small, very narrow leaves, and slender, delicate branches showing a beautiful gray-blue where the thin bark curls away in sections. The branches of this tree look quite feathery, and are a dream of soft color as they wave gently in the breeze.

The big Eucalypti are noted for their tendency to "steal" from other trees. Their roots will travel great distances for moisture. When other trees in their vicinity decline, or a leaky water-pipe becomes clogged, you can

be sure that this enterprising thief is at fault. The remedy is to dig a trench about a yard deep around the guilty tree, which will keep the roots in their own territory.

We have only to look at the arid, desert-like countries in and about the Arabian Peninsula to realize how necessary trees are for the beauty and prosperity of a country. These countries, we are told, were once covered with forests, traversed by rivers, and plentifully supplied with rainfall. Now there is little rain, trees grow only in the deep recesses of the mountains, and the rivers are dried up, save when they overflow their banks from unusual rain.

It is well known that tree-covered land not only attracts but stores rainfall, thus furnishing continuous flow for springs and rivers. Even a small island, if forest-covered, will draw rain to its slopes. We all have noticed how rocky and deep-rutted, ground that is barren of vegetation appears. Any rain which does fall upon it runs unchecked off the surface, carrying the top soil away. It is for these reasons that so much interest is becoming centered in reforesting our country.

Records say that Point Loma was once densely wooded, and so the Râja Yoga boys and the grown-ups in the forestry department are determined to restore the growth of trees, and many thousands of trees, including several varieties of pine, besides the Eucalyptus, have been planted.

It is delightful to walk toward the ocean shore through the grove of big Eucalypti. One hears the roar of the ocean mingled with the sound of wind in the trees, and soon through the waving branches at the cliff's edge one can see the blue ocean and the white caps sparkling beyond. The fragrance of the trees adds a charm to the spot. STUDENT

"It is a Comely Fashion to be Glad"

IF the fairy godmother should appear at the birth of a little girl, and offer for her a choice of beauty, health, talent, or a cheerful disposition, I would choose the last. This would prove the most precious gift of all, for with it as a talisman she could command the other three.

No face can look ugly if the light of happiness shines in the eyes. Joy sends the blood flowing healthfully through the body, and brings it freshness and strength. All power of expression lies hidden in the soul, just as the beauty and fragrance of the flower are sleeping in the seed. A happy nature brings out the talent, just as the sun's light and warmth unfold the blossom. Everyone is a little center of influence, radiating something. What shall it be? How foolish for one to go about with a sorrowful face!

There is the familiar picture of the girl who is always having her feelings hurt, and who thinks that she suffers so much more than other people. Her pale and melancholy face and timid manner reveal the lack of mental poise, and show that her mind is centered in herself. If she were taught to look upon life from the standpoint of duty, she would find that all her grievances are fancied, and she would meet the real sorrows with such courage that everyone would find her an inspiration.

Here is a secret: "Life is Joy" when all the rubbish of fear and despondency is cleared away.

The children of the Râja Yoga School have learned this secret and are teaching by their lives that the day of needless suffering is passed, and that a true note of happiness has been sounded by those who live for the purpose of serving others. A glad discovery indeed is this for all young folk to make. W.

THE CHILDREN'S HOUR

Nisse Frog and Tagge Horntoad on Another Expedition

NISSE Frog and Tagge Horntoad had planned to go on a geographical expedition next spring, but something took place which changed their plans. One day at the end of September Nisse Frog's uncle, Clumpsy, who lives in the Râja Yoga Academy garden, came almost rolling into Nisse's cave-dwelling, breathless from his great exertion.

"Nisse," he panted, "can it be true that there are no flowers at this time of the year? Mind you—no flowers! Do you understand what that means?—I would not live the day when there were no flowers."

"But how do you know this, uncle?" said Nisse.

"Did I not hear it said by a human this very morning? With my own ears I heard it! Not that I care for myself, but everything gets so dull and cheerless, even the birds will be dull, and their singing—"

"Calm yourself, uncle. Calm yourself. I shall soon find out about it," said Nisse. "One should never draw conclusions before investigating thoroughly, as I always do. Let us begin at once, systematically, by finding out the temperature and the humidity. Tagge Horntoad! Where do you keep yourself?"

"Here I am, Nisse," said Tagge, sliding down from the roof. "Has anything wrong happened?"

"Wrong! My dear Horntoad, a statement has been overheard that there are no flowers at this time of the year. No flowers! Think of it!"

"Can it be possible, Mr. Clumpsy," said Tagge. "Did you not see any on your way here?"

"Dear, dear," moaned the uncle, "I never thought of looking, I was in such a hurry. Nisse, my boy, what do you say to our going to find out? We might take a tour around the whole country."

"That would have done very well, if we had been living ages ago, but we have easier methods now-a-days. You just make yourself comfortable on that shaded stone and I will do the rest. Tagge, you run and ask the oldest burrowing-worm how deep he must go to get to the moisture, and send a reliable rain-bug here to report about the latest rain."

Nisse sat making his calculations, resting his chin on his foot. Uncle Clumpsy looked at him with great admiration. "Nisse," he said at last, "you know that I am your only real uncle, and —" but now Tagge came rushing in, his eyes pink from excitement.

"Nisse," he called, "there are beautiful white water-lilies in bloom on the little fish-pond; the bridge is purple with morning-glory; the small eucalyptus is full of bloom; the tree-mallows are pink all over; I met African daisies every ten steps; blue everlasting, rose-mary —"

"Tagge, Tagge," said Nisse sternly, "did I not send you to interview the burrowing-

Lomaland Photo. and Engraving Dept.

I LOVE LOMALAND

I met a little elf-man once,
Down where the lilies blow.
I asked him why he was so small
And why he didn't grow.

He slightly frowned and with his eye,
He looked me through and through,
"I'm just as big for me," said he,
"As you are big for you."

worm? Go at once and do what I told you."

Shortly Tagge returned, as excited as before. "Nisse! I saw many big clumps of cosmos flowers, pink, white, and red; they were as tall as men. I saw white crocus, heliotrope, sweet alyssum, lavender, daisies, pink sorrel, verbenas, catnip, St. Johnswort, pennyroyal, marigold —"

"Tagge! When will you stop! Have you done my errand? No! Do you not yet understand that this is a serious investigation, and that my time is precious? Wait! I had better go and find the burrowing-worm myself; come, Uncle."

They had not gone very far when Tagge commenced: "Nisse! Do you see the white —" but then Nisse stopped, turned to him, and said: "Tagge Horntoad! You have always been my friend; I shall ever remember the great services you have done me and my family; but I tell you this one thing, first and last: Do — not — disturb — me!"

With this, Nisse went his way, carefully

examining the ground at every step, that the right worm-hole should not escape his notice.

"Mr. Clumpsy," whispered Tagge, "do you see that great big bush full of white flowers?"

"I do think that I see some such thing," said Uncle Clumpsy in a low voice, with a shy glance at his nephew.

"That is plumbago," continued Tagge, "there are many bushes, all covered with flowers. These bright yellow blossoms look like daisies, but they are called something else. Oh, the sweet things! Do you smell them? Violets are blooming in the shade of that big bush. Mr. Clumpsy, can you see what the humming-birds are so busy about? Ah! I thought so! Look high up; the humming-bird trees are full of flowers. Ha, ha! This makes me laugh. Just look at that small yucca palm with a bunch of flowers as big as a watering-can, on a thick stalk in the center."

"Why are those feather plumes stuck on sticks in that tall grass, I wonder," said Uncle Clumpsy.

"They are not bird-feathers; they are the blooms of pampas-grass," said Tagge. "Are they not soft and silvery?"

"I have decided to go to another garden," said Nisse, "since my search here has not been successful. Come, Uncle and Tagge."

"Are not these our dear old pink geraniums on either side of the road, Mr. Horntoad?" whispered Uncle Clumpsy presently.

"True," answered Tagge, "and there are beautiful white ones also, and those little pin-cushions in all shades of pink and lavender, on long slender stems are scabiosas, and do you see the bushes which look as if they were on fire on the dry sandy bank? Close by stand their cousins dressed in white flowers; poor things, they have only Latin names!"

"Look! The pepper-trees are hanging full of pale-red flower clusters," said Uncle Clumpsy.

"They are berries," said Tagge.

"I see; then all the yellow ones on the small trees by the big house are also berries?"

"No! Those are acacia trees in bloom; but let us hasten, Nisse is already far ahead."

"What is the matter Nisse?" asked Tagge, running to him.

"I thought I saw a gopher-hole and then I stuck myself on some sharp thorns," moaned Nisse. "It must be a rosebush, and — but what am I sitting on? — a rose! Ah! Look here! The bush is full of them! What did I tell you, Uncle? Did I not say that I was going to find out if there were any flowers? Look around you! Not ten steps away are more carnations than a frog could count in a week, from deepest red to palest white; and do you not smell the lemon-verbena? I tell you, this is wonderful! Look at the oleanders covered with lovely pink blossoms — and the chrysanthemums coming out — but this is quite enough for one day. Let us go home. What queer notions some humans have!" YLVA

THE SECRET DOCTRINE

THE MYSTERIES OF THE HEART DOCTRINE

PREPARED BY
KATHERINE TINGLEY
AND HER PUPILS

The Theosophical Book *of the* Twentieth Century

Tells the story and the history of the Theosophical Movement.

The prices are \$2 in cloth and \$1 in paper, which barely cover the cost, for it is printed and bound, not gaudily, but with such carefulness and thoroughness of art and craft as to make it unique among modern edition books.

ORDER FROM THE
THEOSOPHICAL PUBLISHING CO., POINT LOMA, CAL.

Isis Conservatory of Music

OF THE UNIVERSAL BROTHERHOOD
AND THEOSOPHICAL SOCIETY
POINT LOMA, CALIFORNIA

Personal applications and inquiries received every Saturday
by the Secretary at SAN DIEGO BRANCH

between the hours of 9 A. M. and 4 P. M. Full particu-
lars will be sent by mail upon application to

J. H. FUSSELL, SECRETARY AND TREASURER,
ISIS CONSERVATORY OF MUSIC, Point Loma, California

SOME OF THE ERRORS OF CHRISTIAN SCIENCE CRITICISM

BY H. P. BLAVATSKY AND WILLIAM Q. JUDGE

CONTENTS

"The Empty Vessel Makes the Greatest Sound"
A Note of Warning

—by H. P. Blavatsky

Of "Metaphysical Healing"

Affirmations and Denials

The Cure of Diseases

Replanting Diseases for Future Use

—by William Q. Judge

A MOST VALUABLE PAMPHLET. Outside of Theosophy there is given no adequate explanation of the healing that is at times accomplished, nor of its rationale, nor of the ultimate price that must be paid and the dangers connected with such practices.

This pamphlet is invaluable to all students.
